

# ESP32

## ESP-IDF Programming Guide

Release v4.1.4-1-g349385c  
Espressif Systems  
Dec 12, 2022

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.3 Development Board Overviews	4
1.3.1 ESP32-DevKitC V4 Getting Started Guide	4
1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide	9
1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide	31
1.3.4 ESP32-Ethernet-Kit V1.1 Getting Started Guide	41
1.4 Installation Step by Step	58
1.4.1 Setting up Development Environment	58
1.4.2 Creating Your First Project	58
1.5 Step 1. Install prerequisites	58
1.5.1 Standard Setup of Toolchain for Windows	59
1.5.2 Standard Setup of Toolchain for Linux	64
1.5.3 Standard Setup of Toolchain for Mac OS	64
1.6 Step 2. Get ESP-IDF	66
1.6.1 Linux and macOS	66
1.6.2 Windows	66
1.7 Step 3. Set up the tools	66
1.7.1 Windows	67
1.7.2 Linux and macOS	67
1.7.3 Alternative File Downloads	67
1.7.4 Customizing the tools installation path	68
1.8 Step 4. Set up the environment variables	68
1.8.1 Windows	68
1.8.2 Linux and macOS	68
1.9 Step 5. Start a Project	68
1.9.1 Linux and macOS	69
1.9.2 Windows	69
1.10 Step 6. Connect Your Device	69
1.11 Step 7. Configure	69
1.11.1 Linux and macOS	69
1.11.2 Windows	69
1.12 Step 8. Build the Project	70
1.13 Step 9. Flash onto the Device	71
1.14 Step 10. Monitor	72
1.15 Updating ESP-IDF	73
1.16 Related Documents	73
1.16.1 Establish Serial Connection with ESP32	73
1.16.2 Build and Flash with Eclipse IDE	79
1.16.3 IDF Monitor	79
1.16.4 Customized Setup of Toolchain	83
1.16.5 Get Started (Legacy GNU Make)	88
<b>2 API Reference</b>	<b>113</b>

2.1	Bluetooth API	113
2.1.1	Controller && VHCI	113
2.1.2	BT COMMON	120
2.1.3	BT LE	124
2.1.4	CLASSIC BT	200
2.1.5	NimBLE-based host APIs	275
2.1.6	ESP-BLE-MESH	277
2.2	Networking APIs	490
2.2.1	Wi-Fi	490
2.2.2	Ethernet	560
2.2.3	IP Network Layer	574
2.2.4	Application Layer	588
2.3	Peripherals API	588
2.3.1	Analog to Digital Converter	588
2.3.2	Controller Area Network (CAN)	603
2.3.3	Digital To Analog Converter	618
2.3.4	GPIO & RTC GPIO	621
2.3.5	I2C Driver	634
2.3.6	I2S	647
2.3.7	LED Control	657
2.3.8	MCPWM	670
2.3.9	Pulse Counter	688
2.3.10	RMT	696
2.3.11	SD Pull-up Requirements	712
2.3.12	SDMMC Host Driver	716
2.3.13	SD SPI Host Driver	720
2.3.14	SDIO Card Slave Driver	723
2.3.15	Sigma-delta Modulation	733
2.3.16	SPI Master Driver	735
2.3.17	SPI Slave Driver	753
2.3.18	ESP32-S2 Temperature Sensor	760
2.3.19	Timer	762
2.3.20	Touch Sensor	772
2.3.21	UART	778
2.4	Application Protocols	801
2.4.1	ASIO port	801
2.4.2	ESP-MQTT	801
2.4.3	ESP-TLS	812
2.4.4	ESP HTTP Client	821
2.4.5	HTTP Server	833
2.4.6	HTTPS server	853
2.4.7	ICMP Echo	855
2.4.8	ESP Local Control	860
2.4.9	mDNS Service	867
2.4.10	ESP-Modbus	875
2.4.11	ESP WebSocket Client	880
2.4.12	ESP Serial Slave Link	885
2.4.13	IP Network Layer	890
2.5	Provisioning API	891
2.5.1	Protocol Communication	891
2.5.2	Unified Provisioning	900
2.5.3	Wi-Fi Provisioning	904
2.6	Storage API	920
2.6.1	FAT Filesystem Support	920
2.6.2	Manufacturing Utility	924
2.6.3	Non-volatile storage library	929
2.6.4	NVS Partition Generator Utility	947
2.6.5	SD/SDIO/MMC Driver	954

2.6.6	SPI Flash API	963
2.6.7	SPIFFS Filesystem	982
2.6.8	Virtual filesystem component	986
2.6.9	Wear Levelling API	995
2.7	System API	999
2.7.1	App Image Format	999
2.7.2	Application Level Tracing	1003
2.7.3	eFuse Manager	1008
2.7.4	Error Codes and Helper Functions	1018
2.7.5	ESP HTTPS OTA	1020
2.7.6	ESP-pthread	1023
2.7.7	Event Loop Library	1025
2.7.8	FreeRTOS	1038
2.7.9	FreeRTOS Additions	1116
2.7.10	Heap Memory Allocation	1132
2.7.11	Heap Memory Debugging	1143
2.7.12	High Resolution Timer	1153
2.7.13	The himem allocation API	1157
2.7.14	Inter-Processor Call	1159
2.7.15	Call function with external stack	1161
2.7.16	Interrupt allocation	1162
2.7.17	Logging library	1167
2.7.18	Miscellaneous System APIs	1172
2.7.19	Over The Air Updates (OTA)	1179
2.7.20	Performance Monitor	1188
2.7.21	Power Management	1191
2.7.22	Sleep Modes	1196
2.7.23	Watchdogs	1204
2.7.24	System Time	1207
2.8	Project Configuration	1211
2.8.1	Introduction	1211
2.8.2	Project Configuration Menu	1211
2.8.3	Using sdkconfig.defaults	1212
2.8.4	Kconfig Formatting Rules	1212
2.8.5	Backward Compatibility of Kconfig Options	1212
2.8.6	Configuration Options Reference	1213
2.8.7	Customisations	1379
2.9	Error Codes Reference	1379
<b>3</b>	<b>ESP32 Hardware Reference</b>	<b>1385</b>
3.1	ESP32 Modules and Boards	1385
3.1.1	Modules	1385
3.1.2	Development Boards	1388
3.1.3	Related Documents	1391
3.2	Previous Versions of ESP32 Modules and Boards	1391
3.2.1	Modules (No updated or discontinued modules)	1391
3.2.2	Development Boards	1391
3.2.3	Related Documents	1396
<b>4</b>	<b>ESP32-S2 Beta Preview Support</b>	<b>1397</b>
4.1	Documentation	1397
4.2	Setting up for ESP32-S2 Beta	1397
4.2.1	Manual toolchain URLs	1397
4.3	Building a project for ESP32-S2 Beta	1398
4.4	Limitations	1398
4.5	Roadmap	1398
4.6	Issues	1399

<b>5</b>	<b>API Guides</b>	<b>1401</b>
5.1	Application Level Tracing library	1401
5.1.1	Overview	1401
5.1.2	Modes of Operation	1401
5.1.3	Configuration Options and Dependencies	1402
5.1.4	How to use this library	1403
5.2	BluFi	1412
5.2.1	Overview	1412
5.2.2	The BluFi Flow	1412
5.2.3	The flow chart of BluFi	1413
5.2.4	The Frame Formats Defined in BluFi	1413
5.2.5	The Security Implementation of ESP32	1417
5.2.6	GATT Related Instructions	1418
5.3	Bootloader	1418
5.3.1	Bootloader compatibility	1418
5.3.2	FACTORY reset	1419
5.3.3	Boot from TEST firmware	1420
5.3.4	Fast boot from Deep Sleep	1420
5.3.5	Customer bootloader	1420
5.4	Build System	1420
5.4.1	Overview	1421
5.4.2	Using the Build System	1421
5.4.3	Example Project	1424
5.4.4	Project CMakeLists File	1425
5.4.5	Component CMakeLists Files	1426
5.4.6	Component Configuration	1428
5.4.7	Preprocessor Definitions	1429
5.4.8	Component Requirements	1429
5.4.9	Overriding Parts of the Project	1432
5.4.10	Configuration-Only Components	1432
5.4.11	Debugging CMake	1433
5.4.12	Example Component CMakeLists	1433
5.4.13	Custom sdkconfig defaults	1437
5.4.14	Flash arguments	1437
5.4.15	Building the Bootloader	1438
5.4.16	Selecting the Target	1438
5.4.17	Writing Pure CMake Components	1438
5.4.18	Using Third-Party CMake Projects with Components	1439
5.4.19	Using Prebuilt Libraries with Components	1440
5.4.20	Using ESP-IDF in Custom CMake Projects	1440
5.4.21	ESP-IDF CMake Build System API	1441
5.4.22	File Globbing & Incremental Builds	1444
5.4.23	Build System Metadata	1445
5.4.24	Build System Internals	1446
5.4.25	Migrating from ESP-IDF GNU Make System	1448
5.5	Build System (Legacy GNU Make)	1450
5.5.1	Using the Build System	1450
5.5.2	Overview	1450
5.5.3	Building the Bootloader	1460
5.6	Console	1460
5.6.1	Line editing	1461
5.6.2	Splitting of command line into arguments	1462
5.6.3	Argument parsing	1462
5.6.4	Command registration and dispatching	1462
5.6.5	Example	1463
5.7	Deep Sleep Wake Stubs	1463
5.7.1	Rules for Wake Stubs	1463
5.7.2	Implementing A Stub	1463

5.7.3	Loading Code Into RTC Memory . . . . .	1464
5.7.4	Loading Data Into RTC Memory . . . . .	1464
5.8	Error Handling . . . . .	1465
5.8.1	Overview . . . . .	1465
5.8.2	Error codes . . . . .	1465
5.8.3	Converting error codes to error messages . . . . .	1465
5.8.4	ESP_ERROR_CHECK macro . . . . .	1466
5.8.5	Error handling patterns . . . . .	1466
5.8.6	C++ Exceptions . . . . .	1467
5.9	ESP-BLE-MESH . . . . .	1467
5.9.1	Getting Started with ESP-BLE-MESH . . . . .	1468
5.9.2	ESP-BLE-MESH Examples . . . . .	1475
5.9.3	ESP-BLE-MESH Demo Videos . . . . .	1475
5.9.4	ESP-BLE-MESH FAQ . . . . .	1475
5.9.5	Related Documents . . . . .	1475
5.10	ESP-MESH . . . . .	1504
5.10.1	Overview . . . . .	1504
5.10.2	Introduction . . . . .	1504
5.10.3	ESP-MESH Concepts . . . . .	1505
5.10.4	Building a Network . . . . .	1511
5.10.5	Managing a Network . . . . .	1516
5.10.6	Data Transmission . . . . .	1519
5.10.7	Channel Switching . . . . .	1521
5.10.8	Performance . . . . .	1524
5.10.9	Further Notes . . . . .	1525
5.11	ESP32 Core Dump . . . . .	1525
5.11.1	Overview . . . . .	1525
5.11.2	Configuration . . . . .	1525
5.11.3	Save core dump to flash . . . . .	1526
5.11.4	Print core dump to UART . . . . .	1526
5.11.5	ROM Functions in Backtraces . . . . .	1526
5.11.6	Running ‘espcoredump.py’ . . . . .	1526
5.12	Event Handling . . . . .	1527
5.12.1	Wi-Fi, Ethernet, and IP Events . . . . .	1527
5.12.2	Mesh Events . . . . .	1529
5.12.3	Bluetooth Events . . . . .	1529
5.13	Support for external RAM . . . . .	1529
5.13.1	Introduction . . . . .	1529
5.13.2	Hardware . . . . .	1529
5.13.3	Configuring External RAM . . . . .	1530
5.13.4	Restrictions . . . . .	1531
5.13.5	Chip revisions . . . . .	1531
5.14	Fatal Errors . . . . .	1532
5.14.1	Overview . . . . .	1532
5.14.2	Panic Handler . . . . .	1532
5.14.3	Register Dump and Backtrace . . . . .	1533
5.14.4	GDB Stub . . . . .	1535
5.14.5	Guru Meditation Errors . . . . .	1536
5.14.6	Other Fatal Errors . . . . .	1537
5.15	Flash Encryption . . . . .	1538
5.15.1	Introduction . . . . .	1538
5.15.2	eFuse Used During Flash Encryption Process . . . . .	1539
5.15.3	Flash Encryption Process . . . . .	1539
5.15.4	Steps to Setup Flash Encryption . . . . .	1540
5.15.5	Key Points About Flash Encryption . . . . .	1547
5.15.6	Using Encrypted Flash . . . . .	1547
5.15.7	Updating Encrypted Flash . . . . .	1548
5.15.8	Disabling Flash Encryption . . . . .	1548

5.15.9	Limitations of Flash Encryption . . . . .	1548
5.15.10	Flash Encryption and Secure Boot . . . . .	1549
5.15.11	Advanced Features . . . . .	1549
5.15.12	Technical Details . . . . .	1550
5.16	ESP-IDF FreeRTOS SMP Changes . . . . .	1551
5.16.1	Overview . . . . .	1551
5.16.2	Backported Features . . . . .	1552
5.16.3	Tasks and Task Creation . . . . .	1553
5.16.4	Scheduling . . . . .	1553
5.16.5	Critical Sections & Disabling Interrupts . . . . .	1556
5.16.6	Floating Point Arithmetic . . . . .	1556
5.16.7	Task Deletion . . . . .	1557
5.16.8	Thread Local Storage Pointers & Deletion Callbacks . . . . .	1557
5.16.9	Configuring ESP-IDF FreeRTOS . . . . .	1557
5.17	General Notes About ESP-IDF Programming . . . . .	1558
5.17.1	Application startup flow . . . . .	1558
5.17.2	Application memory layout . . . . .	1559
5.17.3	DMA Capable Requirement . . . . .	1561
5.18	High-Level Interrupts . . . . .	1562
5.18.1	Interrupt Levels . . . . .	1562
5.18.2	Notes . . . . .	1563
5.19	JTAG Debugging . . . . .	1563
5.19.1	Introduction . . . . .	1563
5.19.2	How it Works? . . . . .	1564
5.19.3	Selecting JTAG Adapter . . . . .	1564
5.19.4	Setup of OpenOCD . . . . .	1565
5.19.5	Configuring ESP32 Target . . . . .	1565
5.19.6	Launching Debugger . . . . .	1570
5.19.7	Debugging Examples . . . . .	1570
5.19.8	Building OpenOCD from Sources . . . . .	1571
5.19.9	Tips and Quirks . . . . .	1575
5.19.10	Related Documents . . . . .	1575
5.20	Linker Script Generation . . . . .	1603
5.20.1	Overview . . . . .	1603
5.20.2	Quick Start . . . . .	1604
5.20.3	Linker Script Generation Internals . . . . .	1607
5.21	lwIP . . . . .	1612
5.21.1	Supported APIs . . . . .	1612
5.21.2	BSD Sockets API . . . . .	1612
5.21.3	Netconn API . . . . .	1616
5.21.4	lwIP FreeRTOS Task . . . . .	1616
5.21.5	esp-lwip custom modifications . . . . .	1617
5.21.6	Performance Optimization . . . . .	1618
5.22	Partition Tables . . . . .	1619
5.22.1	Overview . . . . .	1619
5.22.2	Built-in Partition Tables . . . . .	1619
5.22.3	Creating Custom Tables . . . . .	1620
5.22.4	Generating Binary Partition Table . . . . .	1621
5.22.5	Flashing the partition table . . . . .	1622
5.22.6	Partition Tool (parttool.py) . . . . .	1622
5.23	RF calibration . . . . .	1624
5.23.1	Partial calibration . . . . .	1624
5.23.2	Full calibration . . . . .	1624
5.23.3	No calibration . . . . .	1624
5.23.4	PHY initialization data . . . . .	1624
5.24	ESP32 ROM console . . . . .	1625
5.24.1	Full list of supported statements and functions . . . . .	1625
5.24.2	Example programs . . . . .	1626

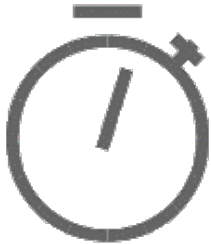

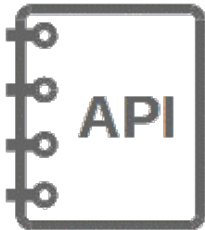

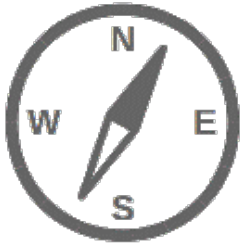

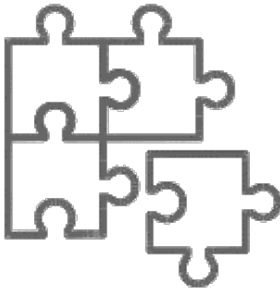

5.24.3	Credits . . . . .	1626
5.25	Secure Boot . . . . .	1626
5.25.1	Background . . . . .	1627
5.25.2	Secure Boot Process Overview . . . . .	1627
5.25.3	Keys . . . . .	1627
5.25.4	Bootloader Size . . . . .	1628
5.25.5	How To Enable Secure Boot . . . . .	1628
5.25.6	Re-Flashable Software Bootloader . . . . .	1629
5.25.7	Generating Secure Boot Signing Key . . . . .	1630
5.25.8	Remote Signing of Images . . . . .	1630
5.25.9	Secure Boot Best Practices . . . . .	1630
5.25.10	Technical Details . . . . .	1630
5.25.11	Secure Boot & Flash Encryption . . . . .	1632
5.25.12	Signed App Verification Without Hardware Secure Boot . . . . .	1632
5.25.13	Advanced Features . . . . .	1632
5.26	Secure Boot V2 . . . . .	1633
5.26.1	Background . . . . .	1633
5.26.2	Advantages . . . . .	1633
5.26.3	Secure Boot V2 Process . . . . .	1633
5.26.4	Signature Block Format . . . . .	1634
5.26.5	Verifying the signature Block . . . . .	1634
5.26.6	Bootloader Size . . . . .	1634
5.26.7	eFuse usage . . . . .	1635
5.26.8	How To Enable Secure Boot V2 . . . . .	1635
5.26.9	Restrictions after Secure Boot is enabled . . . . .	1636
5.26.10	Generating Secure Boot Signing Key . . . . .	1636
5.26.11	Remote Signing of Images . . . . .	1636
5.26.12	Secure Boot Best Practices . . . . .	1637
5.26.13	Technical Details . . . . .	1637
5.26.14	Secure Boot & Flash Encryption . . . . .	1637
5.26.15	Advanced Features . . . . .	1637
5.27	Thread Local Storage . . . . .	1637
5.27.1	Overview . . . . .	1637
5.27.2	FreeRTOS Native API . . . . .	1638
5.27.3	Pthread API . . . . .	1638
5.27.4	C11 Standard . . . . .	1638
5.28	Tools . . . . .	1638
5.28.1	IDF Docker Image . . . . .	1638
5.28.2	IDF Component Manager . . . . .	1640
5.29	ULP Coprocessor programming . . . . .	1642
5.29.1	ESP32 ULP coprocessor instruction set . . . . .	1642
5.29.2	ESP32-S2 ULP coprocessor instruction set . . . . .	1654
5.29.3	Programming ULP coprocessor using C macros . . . . .	1671
5.29.4	Installing the Toolchain . . . . .	1675
5.29.5	Compiling the ULP Code . . . . .	1676
5.29.6	Accessing the ULP Program Variables . . . . .	1676
5.29.7	Starting the ULP Program . . . . .	1677
5.29.8	ULP Program Flow . . . . .	1678
5.30	The ULP Coprocessor (Legacy GNU Make) . . . . .	1679
5.30.1	Installing the Toolchain . . . . .	1679
5.30.2	Compiling the ULP Code . . . . .	1680
5.30.3	Accessing the ULP Program Variables . . . . .	1680
5.30.4	Starting the ULP Program . . . . .	1681
5.30.5	ULP Program Flow . . . . .	1682
5.31	Unit Testing (Legacy GNU Make) . . . . .	1683
5.31.1	Normal Test Cases . . . . .	1683
5.31.2	Multi-device Test Cases . . . . .	1684
5.31.3	Multi-stage Test Cases . . . . .	1685

5.31.4	Building Unit Test App	1685
5.31.5	Running Unit Tests	1686
5.32	Unit Testing in ESP32	1687
5.32.1	Normal Test Cases	1687
5.32.2	Multi-device Test Cases	1688
5.32.3	Multi-stage Test Cases	1689
5.32.4	Building Unit Test App	1689
5.32.5	Running Unit Tests	1689
5.32.6	Timing Code with Cache Compensated Timer	1690
5.33	Wi-Fi Driver	1691
5.33.1	ESP32 Wi-Fi Feature List	1691
5.33.2	How To Write a Wi-Fi Application	1691
5.33.3	ESP32 Wi-Fi API Error Code	1692
5.33.4	ESP32 Wi-Fi API Parameter Initialization	1693
5.33.5	ESP32 Wi-Fi Programming Model	1693
5.33.6	ESP32 Wi-Fi Event Description	1693
5.33.7	ESP32 Wi-Fi Station General Scenario	1696

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then building, and flashing firmware onto an ESP32 board.

---

**Note:** This is documentation for branch `release/v4.1` of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

Hardware:

- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
- **Text editor** to write programs (**Projects**) in C, e.g., [Eclipse](#)

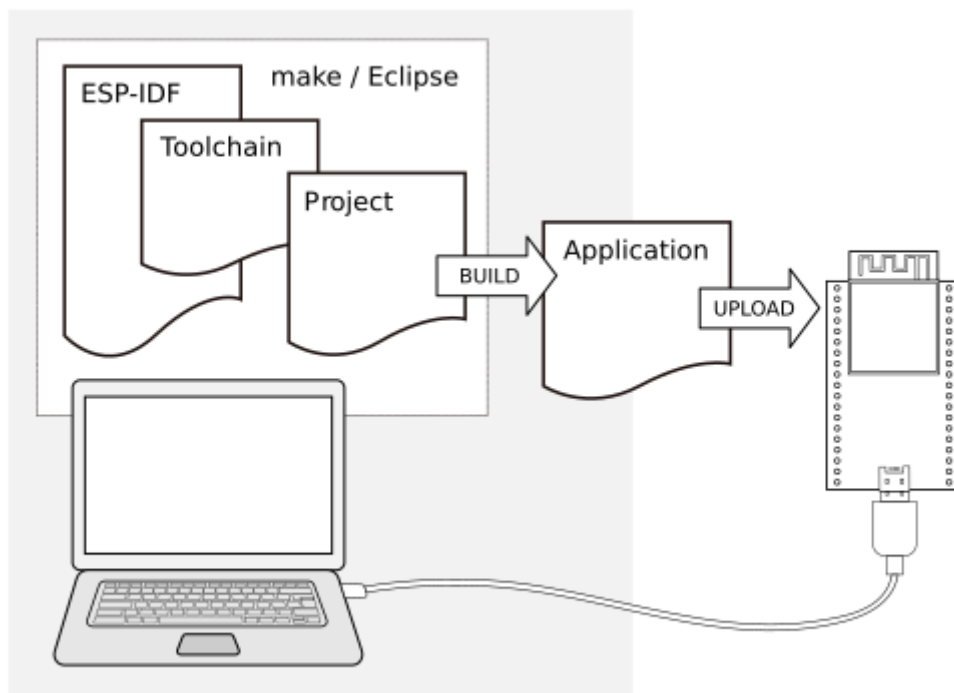

Fig. 1: Development of applications for ESP32

## 1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

### 1.3.1 ESP32-DevKitC V4 Getting Started Guide

This guide shows how to start using the ESP32-DevKitC V4 development board. For description of other versions of ESP32-DevKitC check [ESP32 Hardware Reference](#).

#### What You Need

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section [Start Application Development](#).

#### Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by [Espressif](#). Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - [ESP32-WROOM-32](#)
  - [ESP32-WROOM-32D](#)
  - [ESP32-WROOM-32U](#)

- *ESP32-SOLO-1*
- *ESP32-WROVER*
- *ESP32-WROVER-B*
- *ESP32-WROVER-I*
- *ESP32-WROVER-B (IPEX)*
- male or female pin headers.

For details please refer to [Espressif Product Ordering Information](#).

## Functional Description

The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

Fig. 2: ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered

Key Component	Description
ESP32-WROOM-32	A module with ESP32 at its core.
EN	Reset button.
Boot	Download button. Holding down <b>Boot</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB-to-UART Bridge	Single USB-UART bridge chip provides transfer rates of up to 3 Mbps.
Micro USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32 module.
5V Power On LED	Turns on when the USB or an external 5V power supply is connected to the board. For details see the schematics in <a href="#">Related Documents</a> .
I/O	Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.

---

**Note:** The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

---

---

**Note:** The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

---

### Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

### Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows C15 highlighted in yellow.

Fig. 3: Location of C15 (yellow) on ESP32-DevKitC V4 board

### Start Application Development

Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to [ESP32 Hardware Reference](#), where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

## 1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check [ESP32 Hardware Reference](#).

### What You Need

- [ESP-WROVER-KIT V4.1 board](#)
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section [Start Application Development](#).

### Overview

ESP-WROVER-KIT is an ESP32-based development board produced by [Espressif](#).

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-B module
- LCD screen
- MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board's pin headers for easy access.

---

**Note:** ESP32's GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board's pin headers in order to ensure reliable performance.

---

### Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

### Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture

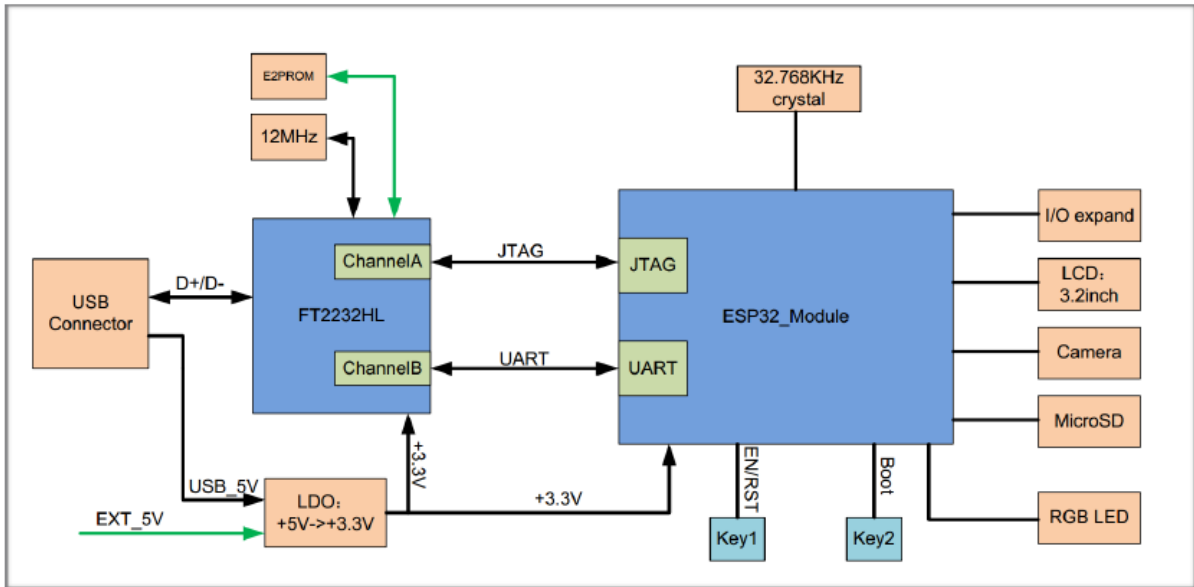

Fig. 6: ESP-WROVER-KIT block diagram

Fig. 7: ESP-WROVER-KIT board layout - front

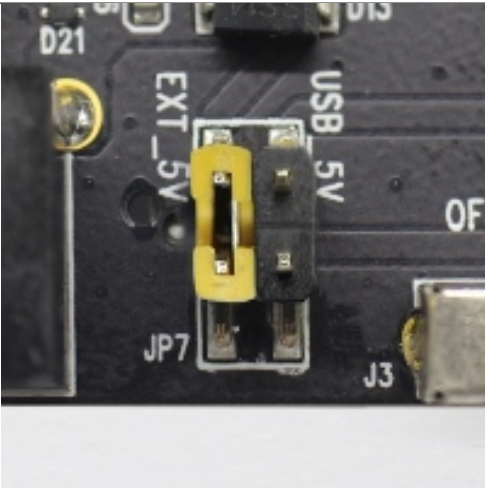

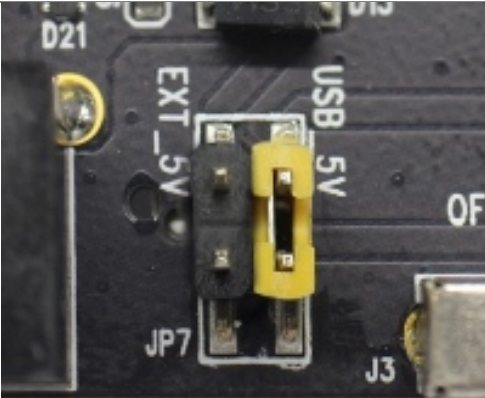

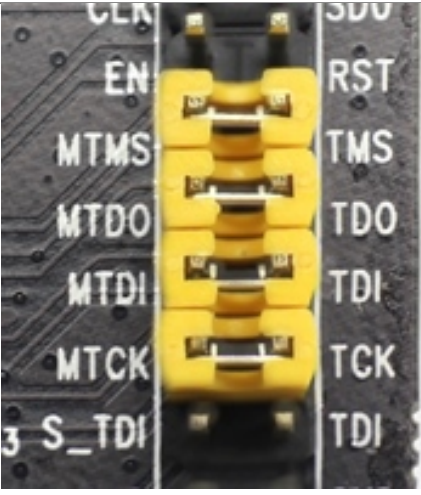

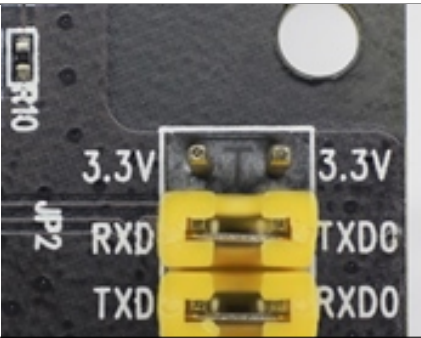

Fig. 8: ESP-WROVER-KIT board layout - back

Key Component	Description
FT2232	The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See <a href="#">ESP-WROVER-KIT V4.1 schematic</a> .
32.768 kHz	External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
0R	Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32's current consumption in different modes.
ESP32-WROVER-B	This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
Diagnostic LEDs	Four red LEDs connected to the GPIO pins of FT2232. Intended for future use.
UART	Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32's serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI	By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the voltage of this interface is 3.3V.
CTS/RTS	Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
JTAG	JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section <a href="#">Setup Options</a> .
USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
EN Button	Reset button.
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.

## Setup Options

There are three jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

Header	Jumper Setting	Description of Functionality
JP7		Power ESP-WROVER-KIT via an external power supply
JP7		Power ESP-WROVER-KIT via USB
JP2		Enable JTAG functionality
JP2		Enable UART communication

## Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1** The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

Shared With	I/O	I/O	Shared With
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	Camera
Camera	IO26	IO25	Camera, LCD
Camera	IO35	IO34	Camera
Camera	IO39	IO36	Camera
JTAG	EN	IO23	Camera, LCD
Camera, LCD	IO22	IO21	Camera, LCD, MicroSD
Camera, LCD	IO19	IO18	Camera, LCD
Camera, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, Camera, MicroSD
Camera, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

Legend:

- NC/XTAL - *32.768 kHz Oscillator*
- JTAG - *JTAG / JP2*
- Boot - *Boot button / SW2*
- Camera - *Camera / JP4*
- LED - *RGB LED*
- MicroSD - *MicroSD Card / J4*
- LCD - *LCD / U5*
- PSRAM - *ESP32-WROVER-B's PSRAM*

### 32.768 kHz Oscillator

.	ESP32 Pin
1	GPIO32
2	GPIO33

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

**SPI Flash / JP2**

.	ESP32 Pin
1	CLK / GPIO6
2	SD0 / GPIO7
3	SD1 / GPIO8
4	SD2 / GPIO9
5	SD3 / GPIO10
6	CMD / GPIO11

---

**Important:** The module's flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module's flash bus from the pin header JP2.

---

**JTAG / JP2**

.	ESP32 Pin	JTAG Signal
1	EN	TRST_N
2	MTMS / GPIO14	TMS
3	MTDO / GPIO15	TDO
4	MTDI / GPIO12	TDI
5	MTCK / GPIO13	TCK

**Camera / JP4**

.	ESP32 Pin	Camera Signal
1	n/a	3.3V
2	n/a	Ground
3	GPIO27	SIO_C / SCCB Clock
4	GPIO26	SIO_D / SCCB Data
5	GPIO25	VSYNC / Vertical Sync
6	GPIO23	HREF / Horizontal Reference
7	GPIO22	PCLK / Pixel Clock
8	GPIO21	XCLK / System Clock
9	GPIO35	D7 / Pixel Data Bit 7
10	GPIO34	D6 / Pixel Data Bit 6
11	GPIO39	D5 / Pixel Data Bit 5
12	GPIO36	D4 / Pixel Data Bit 4
13	GPIO19	D3 / Pixel Data Bit 3
14	GPIO18	D2 / Pixel Data Bit 2
15	GPIO5	D1 / Pixel Data Bit 1
16	GPIO4	D0 / Pixel Data Bit 0
17	GPIO0	RESET / Camera Reset
18	n/a	PWDN / Camera Power Down

- Signals D0 .. D7 denote camera data bus

**RGB LED**

.	ESP32 Pin	RGB LED
1	GPIO0	Red
2	GPIO2	Green
3	GPIO4	Blue

**MicroSD Card**

.	ESP32 Pin	MicroSD Signal
1	MTDI / GPIO12	DATA2
2	MTCK / GPIO13	CD / DATA3
3	MTDO / GPIO15	CMD
4	MTMS / GPIO14	CLK
5	GPIO2	DATA0
6	GPIO4	DATA1
7	GPIO21	CD

**LCD / U5**

.	ESP32 Pin	LCD Signal
1	GPIO18	RESET
2	GPIO19	SCL
3	GPIO21	D/C
4	GPIO22	CS
5	GPIO23	SDA
6	GPIO25	SDO
7	GPIO5	Backlight

**Start Application Development**

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development** Please proceed to [ESP32 Hardware Reference](#), where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

## What You Need

- [ESP-WROVER-KIT V3 board](#)
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section [Start Application Development](#).

**Overview** ESP-WROVER-KIT is an ESP32-based development board produced by [Espressif](#). This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- [ESP32-WROOM-32](#)
- [ESP32-WROVER](#)

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board's pin headers for easy access.

---

**Note:** The version with the ESP32-WROVER module uses ESP32's GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board's pin headers in order to ensure reliable performance.

---

**Functionality Overview** The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

**Functional Description** The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture

Fig. 9: ESP-WROVER-KIT block diagram

Key Component	Description
32.768 kHz	External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
0R	Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32' s current consumption in different modes.
ESP32 Module	Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
FT2232	The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See <a href="#">ESP-WROVER-KIT V3 schematic</a> .
UART	Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32' s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI	By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
CTS/RTS	Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
JTAG	JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section <a href="#">Setup Options</a> .
EN	Reset button.
Boot	Download button. Holding down <b>Boot</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Key	Power On/Off Switch. Toggling toward <b>USB</b> powers the board on, toggling away from <b>USB</b> powers the board off.
Power Select	Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section <a href="#">Setup Options</a> , jumper header JP7.
Espressif Systems	

Fig. 10: ESP-WROVER-KIT board layout - front

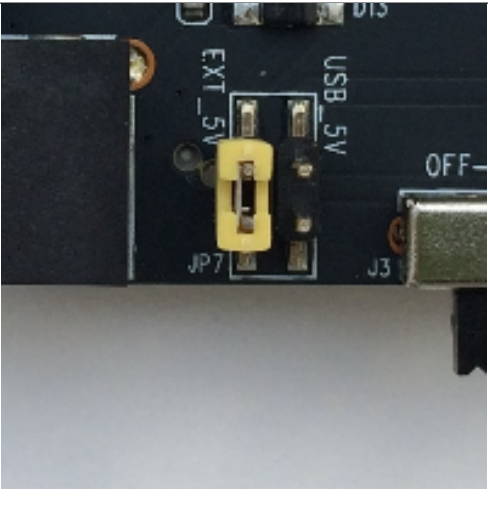

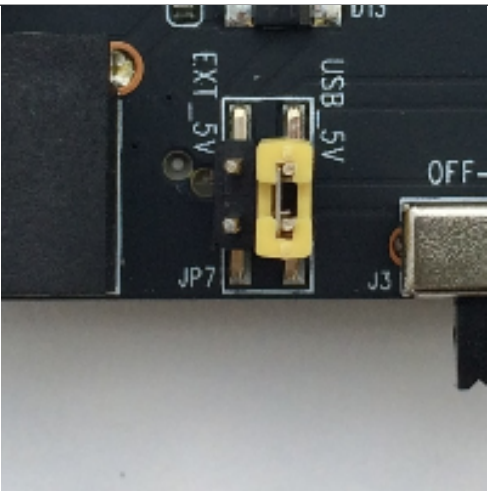

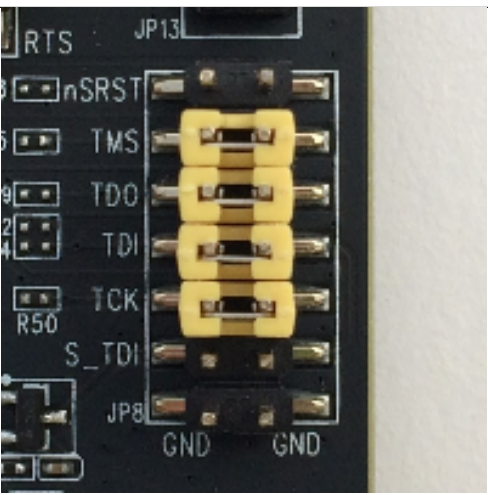

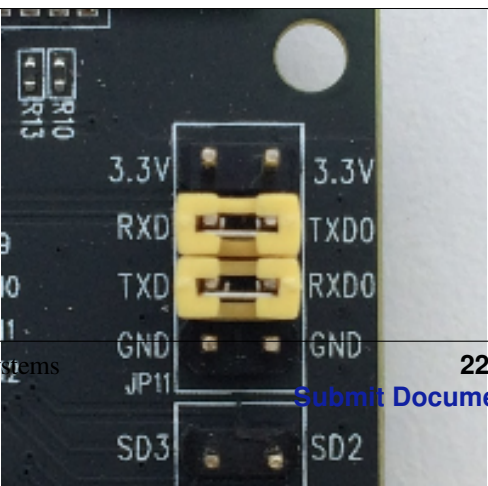

Fig. 11: ESP-WROVER-KIT board layout - back

**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

Header	Jumper Setting	Description of Functionality
JP7		Power ESP-WROVER-KIT via an external power supply
JP7		Power ESP-WROVER-KIT via USB
JP8		Enable JTAG functionality
JP11		Enable UART communication

**Allocation of ESP32 Pins** Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1** The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

Shared With	I/O	I/O	Shared With
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	Camera
Camera	IO26	IO25	Camera, LCD
Camera	IO35	IO34	Camera
Camera	IO39	IO36	Camera
JTAG	EN	IO23	Camera, LCD
Camera, LCD	IO22	IO21	Camera, LCD, MicroSD
Camera, LCD	IO19	IO18	Camera, LCD
Camera, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, Camera, MicroSD
Camera, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

Legend:

- NC/XTAL - *32.768 kHz Oscillator*
- JTAG - *JTAG / JP8*
- Boot - Boot button / SW2
- Camera - *Camera / JP4*
- LED - *RGB LED*
- MicroSD - *MicroSD Card / J4*
- LCD - *LCD / U5*
- PSRAM - only in case ESP32-WROVER is installed

### 32.768 kHz Oscillator

.	ESP32 Pin
1	GPIO32
2	GPIO33

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

**SPI Flash / JP13**

.	ESP32 Pin
1	CLK / GPIO6
2	SD0 / GPIO7
3	SD1 / GPIO8
4	SD2 / GPIO9
5	SD3 / GPIO10
6	CMD / GPIO11

---

**Important:** The module's flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module's flash bus from the pin header JP13.

---

**JTAG / JP8**

.	ESP32 Pin	JTAG Signal
1	EN	TRST_N
2	MTMS / GPIO14	TMS
3	MTDO / GPIO15	TDO
4	MTDI / GPIO12	TDI
5	MTCK / GPIO13	TCK

**Camera / JP4**

.	ESP32 Pin	Camera Signal
1	n/a	3.3V
2	n/a	Ground
3	GPIO27	SIO_C / SCCB Clock
4	GPIO26	SIO_D / SCCB Data
5	GPIO25	VSYNC / Vertical Sync
6	GPIO23	HREF / Horizontal Reference
7	GPIO22	PCLK / Pixel Clock
8	GPIO21	XCLK / System Clock
9	GPIO35	D7 / Pixel Data Bit 7
10	GPIO34	D6 / Pixel Data Bit 6
11	GPIO39	D5 / Pixel Data Bit 5
12	GPIO36	D4 / Pixel Data Bit 4
13	GPIO19	D3 / Pixel Data Bit 3
14	GPIO18	D2 / Pixel Data Bit 2
15	GPIO5	D1 / Pixel Data Bit 1
16	GPIO4	D0 / Pixel Data Bit 0
17	GPIO0	RESET / Camera Reset
18	n/a	PWDN / Camera Power Down

- Signals D0 .. D7 denote camera data bus

**RGB LED**

.	ESP32 Pin	RGB LED
1	GPIO0	Red
2	GPIO2	Green
3	GPIO4	Blue

**MicroSD Card**

.	ESP32 Pin	MicroSD Signal
1	MTDI / GPIO12	DATA2
2	MTCK / GPIO13	CD / DATA3
3	MTDO / GPIO15	CMD
4	MTMS / GPIO14	CLK
5	GPIO2	DATA0
6	GPIO4	DATA1
7	GPIO21	CD

**LCD / U5**

.	ESP32 Pin	LCD Signal
1	GPIO18	RESET
2	GPIO19	SCL
3	GPIO21	D/C
4	GPIO22	CS
5	GPIO23	SDA
6	GPIO25	SDO
7	GPIO5	Backlight

**Start Application Development** Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development** Please proceed to [ESP32 Hardware Reference](#), where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

**ESP-WROVER-KIT V2 Getting Started Guide** This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check [ESP32 Hardware Reference](#).

## What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section [Start Application Development](#).

**Overview** ESP-WROVER-KIT is an ESP32-based development board produced by [Espressif](#). This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- [ESP32-WROOM-32](#)
- [ESP32-WROVER](#)

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board's pin headers for easy access.

---

**Note:** The version with the ESP32-WROVER module uses ESP32's GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board's pin headers in order to ensure reliable performance.

---

**Functionality Overview** The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

**Functional Description** The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture's top right corner and going clockwise
- Then moving on to the second picture

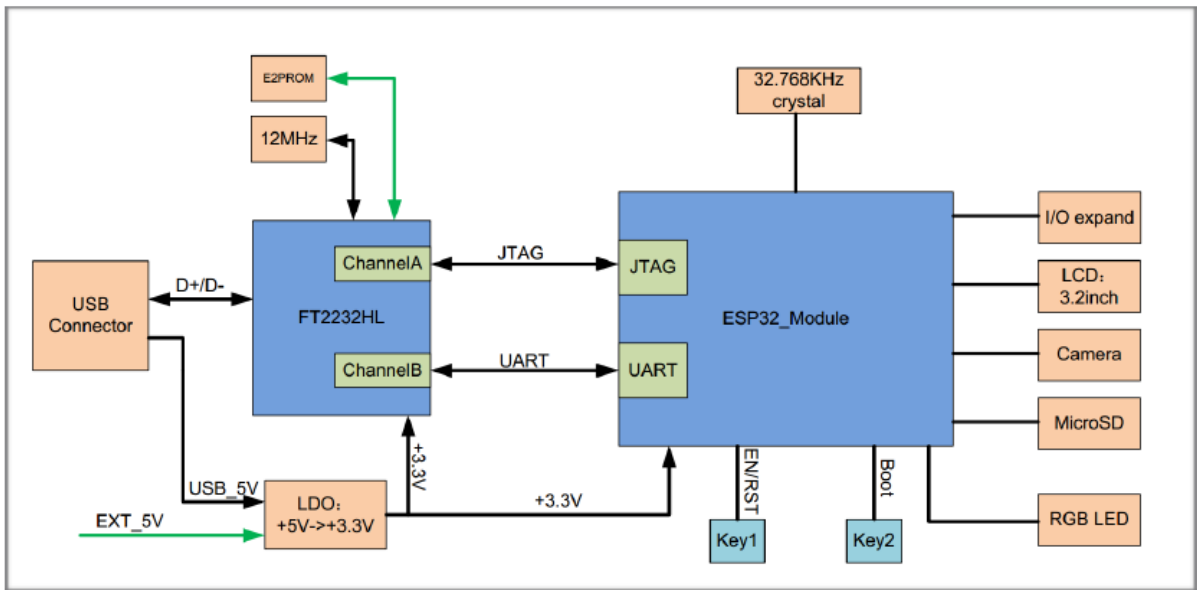

Fig. 12: ESP-WROVER-KIT block diagram

Fig. 13: ESP-WROVER-KIT board layout - front

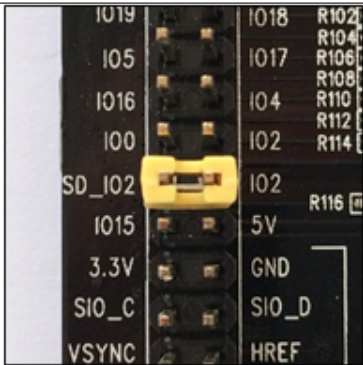

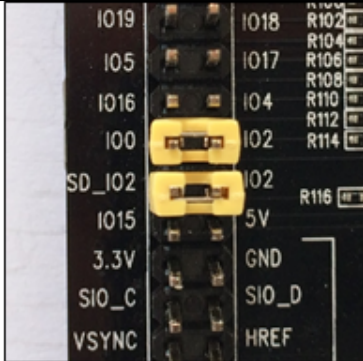

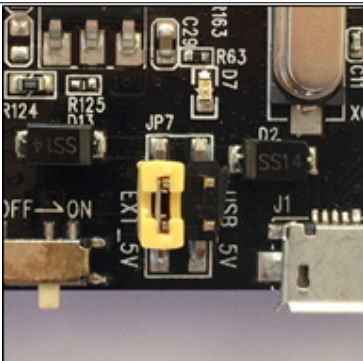

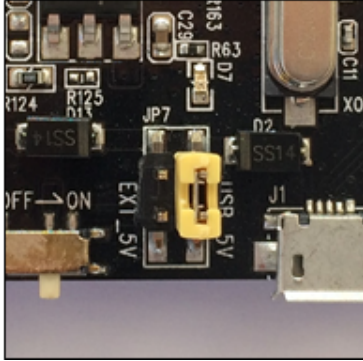

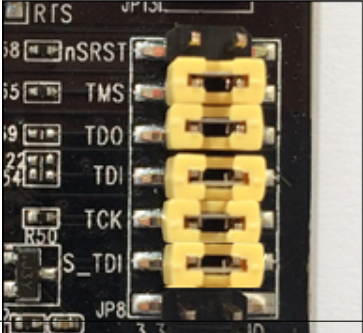

Fig. 14: ESP-WROVER-KIT board layout - back

Key Component	Description
32.768 kHz	External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
ESP32 Module	Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
CTS/RTS	Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
UART	Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32's serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI	By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
JTAG	JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section <a href="#">Setup Options</a> .
FT2232	The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.
EN	Reset button.
Boot	Download button. Holding down <b>Boot</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Select	Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section <a href="#">Setup Options</a> , jumper header JP7.
Power Key	Power On/Off Switch. Toggling toward <b>USB</b> powers the board on, toggling away from <b>USB</b> powers the board off.
5V Input	The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
LDO	NCP1117(1A). 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to <a href="#">ESP-WROVER-KIT V2 schematic</a> .
Camera	Camera interface, a standard OV7670 camera module.
RGB	Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).
I/O	All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.
MicroSD Card	MicroSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the MicroSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section <a href="#">Setup Options</a> .
LCD	Support for mounting and interfacing a 3.2" SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure <a href="#">ESP-WROVER-KIT board layout - back</a> .

**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

Header	Jumper Setting	Description of Functionality
JP1		Enable pull up for the MicroSD Card
JP1		Assert GPIO2 low during each download (by jumping it to GPIO0)
JP7		Power ESP-WROVER-KIT via an external power supply
JP7		Power ESP-WROVER-KIT via USB
JP8		Enable JTAG functionality

**Start Application Development** Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development** Please proceed to *ESP32 Hardware Reference*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

### 1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check *ESP32 Hardware Reference*.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

#### What You Need

- [ESP32-PICO-KIT mini development board](#)
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

## Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by [Espressif](#).

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer's USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1" header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

### Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module's datasheet in [Related Documents](#).
2. ESP32-PICO-KIT comes with male headers by default.

## Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

Fig. 15: ESP32-PICO-KIT block diagram

### Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Fig. 16: ESP32-PICO-KIT board layout

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.

Key Component	Description
ESP32-PICO-D4	Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.
LDO	5V-to-3.3V Low dropout voltage regulator (LDO).
USB-UART bridge	Single-chip USB-UART bridge: CP2102 in V4 provides up to 1 Mbps transfer rates and CP2102N in V4.1 offers up to 3 Mbps transfers rates.
Micro USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
5V Power On LED	This red LED turns on when power is supplied to the board. For details, see the schematics in <a href="#">Related Documents</a> .
I/O	All the pins on ESP32-PICO-D4 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section <a href="#">Pin Descriptions</a> .
BOOT Button	Download button. Holding down <b>Boot</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.
EN Button	Reset button.

### Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

### Pin Descriptions

The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see [ESP32-PICO-KIT board layout](#). The pin numbering and header names are the same as in the schematic given in [Related Documents](#).

## Header J2

No.	Name	Type	Function
1	FLASH_SD1 (FSD1)	I/O	GPIO8, SD_DATA1, SPID, HS1_DATA1 ( <i>See 1</i> ), U2CTS
2	FLASH_SD3 (FSD3)	I/O	GPIO7, SD_DATA0, SPIQ, HS1_DATA0 ( <i>See 1</i> ), U2RTS
3	FLASH_CLK (FCLK)	I/O	GPIO6, SD_CLK, SPICLK, HS1_CLK ( <i>See 1</i> ), U1CTS
4	IO21	I/O	GPIO21, VSPIHD, EMAC_TX_EN
5	IO22	I/O	GPIO22, VSPIWP, U0RTS, EMAC_TXD1
6	IO19	I/O	GPIO19, VSPIQ, U0CTS, EMAC_TXD0
7	IO23	I/O	GPIO23, VSPID, HS1_STROBE
8	IO18	I/O	GPIO18, VSPICLK, HS1_DATA7
9	IO5	I/O	GPIO5, VSPICS0, HS1_DATA6, EMAC_RX_CLK
10	IO10	I/O	GPIO10, SD_DATA3, SPIWP, HS1_DATA3, U1TXD
11	IO9	I/O	GPIO9, SD_DATA2, SPIHD, HS1_DATA2, U1RXD
12	RXD0	I/O	GPIO3, U0RXD ( <i>See 3</i> ), CLK_OUT2
12	TXD0	I/O	

## Header J3

No.	Name	Type	Function
1	FLASH_CS (FCS)	I/O	GPIO16, HS1_DATA4 ( <i>See 1</i> ), U2RXD, EMAC_CLK_OUT
2	FLASH_SD0 (FSD0)	I/O	GPIO17, HS1_DATA5 ( <i>See 1</i> ), U2TXD, EMAC_CLK_OUT_180
3	FLASH_SD2 (FSD2)	I/O	GPIO11, SD_CMD, SPICS0, HS1_CMD ( <i>See 1</i> ), U1RTS
4	SENSOR_VP (FSVP)	I	GPIO36, ADC1_CH0, RTC_GPIO0
5	SENSOR_VN (FSVN)	I	GPIO39, ADC1_CH3, RTC_GPIO3
6	IO25	I/O	GPIO25, DAC_1, ADC2_CH8, RTC_GPIO6, EMAC_RXD0
7	IO26	I/O	GPIO26, DAC_2, ADC2_CH9, RTC_GPIO7, EMAC_RXD1
8	IO32	I/O	32K_XP ( <i>See 2a</i> ), ADC1_CH4, TOUCH9, RTC_GPIO9
9	IO33	I/O	32K_XN ( <i>See 2b</i> ), ADC1_CH5, TOUCH8, RTC_GPIO8
10	IO27	I/O	GPIO27, ADC2_CH7, TOUCH7, RTC_GPIO17 EMAC_RX_DV
Espressif Systems	IO14	37 I/O	Release v4.1.4-1-g349385c ADC2_CH6, TOUCH6, RTC_GPIO16, MTMS, HSPICLK,

The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT's embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

### Start Application Development

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to [ESP32 Hardware Reference](#), where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

### Board Dimensions

The dimensions are 52 x 20.3 x 10 mm (2.1" x 0.8" x 0.4" ).

Fig. 17: ESP32-PICO-KIT dimensions - back

For the board physical construction details, please refer to its Reference Design listed below.

## 1.3.4 ESP32-Ethernet-Kit V1.1 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

### What You Need

- [ESP32-Ethernet-Kit V1.1 board](#)
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

## Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by [Espressif](#).

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

Fig. 20: ESP32-Ethernet-Kit V1.1

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

## Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

## Functional Description

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)** The table below provides description starting from the picture's top right corner and going clockwise.

Fig. 21: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 22: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)

Key Component	Description
ESP32-WROVER-B	This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
GPIO Header 2	Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see <a href="#">GPIO Header 2</a> .
Function Switch	A 4-bit DIP switch used to configure the functionality of selected GPIOs of ESP32. Please note that placement of GPIO pin number marking on the board's silkscreen besides the DIP switch is incorrect. For details and correct pin allocation see <a href="#">Function Switch</a> .
Tx/Rx LEDs	Two LEDs to show the status of UART transmission.
FT232RL	The FT232RL chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT232RL also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT232RL chip enhances user-friendliness in terms of application development and debugging. See <a href="#">ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic</a> .
USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Switch	Power On/Off Switch. Toggling the switch to <b>5V0</b> position powers the board on, toggling to <b>GND</b> position powers the board off.
5V Input	The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
5V Power On LED	This red LED turns on when power is supplied to the board, either from USB or 5V Input.
DC/DC Converter	Provided DC 5 V to 3.3 V conversion, output current up to 2A.
Board B Connectors	A pair male and female header pins for mounting the <a href="#">PoE board (B)</a> .
IP101GR (PHY)	The physical layer (PHY) connection to the Ethernet cable is implemented using the <a href="#">IP101GR</a> chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3 / 802.3u standard of 10/100Mbps.
RJ45 Port	Ethernet network data transmission port.
Magnetics Module	The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.
Link/Activity LEDs	Two LEDs (green and red) that respectively indicate the "Link" and "Activity" statuses of the PHY.
BOOT Button	Download button. Holding down <b>BOOT</b> and then pressing <b>EN</b> initiates Firmware Download mode for downloading firmware through the serial port.
EN Button	Reset button.
GPIO Header 1	This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see <a href="#">GPIO Header 1</a> .

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under [Functionality Overview](#).

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

Fig. 23: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)

Table 1: Table PoE board (B)

Key Component	Description
Board A Connector	Four female (left) and four male (right) header pins for connecting the PoE board (B) to <i>Ethernet board (A)</i> . The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).
External Power Terminals	Optional power supply (26.6 ~ 54 V) to the PoE board (B).

## Setup Options

This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch** When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

DIP SW	GPIO Pin
1	GPIO13
2	GPIO12
3	GPIO15
4	GPIO14

**Note:** Placement of GPIO pin number marking on the board's silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection** The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL.

**Note:** For additional information on the RMI clock selection, please refer to [ESP32-Ethernet-Kit V1.1 Ethernet board \(A\) schematic](#), sheet 2, location D2.

**RMI Clock Sourced Externally by PHY** By default, the ESP32-Ethernet-Kit is configured to provide RMI clock for the IP101GRI PHY's 50M\_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Fig. 24: RMI Clock from IP101GRI PHY

Please note that the PHY is reset on power up by pulling the RESET\_N signal down with a resistor. ESP32 should assert RESET\_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF\_CLK\_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMI Clock Sourced Internally from ESP32's APLL** Another option is to source the RMI Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to [ESP32-Ethernet-Kit V1.1 Ethernet board \(A\) schematic](#), sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMI clock.

Fig. 25: RMIIClock from ESP Internal APLL

## GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface** The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

.	ESP32 Pin (MAC)	IP101GRI (PHY)
<i>RMII Interface</i>		
1	GPIO21	TX_EN
2	GPIO19	TXD[0]
3	GPIO22	TXD[1]
4	GPIO25	RXD[0]
5	GPIO26	RXD[1]
6	GPIO27	CRS_DV
7	GPIO0	REF_CLK
<i>Serial Management Interface</i>		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY Reset</i>		
10	GPIO5	Reset_N

**Note:** Except for REF\_CLK, the allocation of all pins under the ESP32's *RMII Interface* is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1** This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

.	ESP32 Pin
1	GPIO32
2	GPIO33
3	GPIO34
4	GPIO35
5	GPIO36
6	GPIO39

**GPIO Header 2** This header contains GPIOs that may be used for other purposes depending on scenarios described in column "Comments".

.	ESP32 Pin	Comments
1	GPIO17	See note 1
2	GPIO16	See note 1
3	GPIO4	
4	GPIO2	
5	GPIO13	See note 2
6	GPIO12	See note 2
7	GPIO15	See note 2
8	GPIO14	See note 2
9	GND	Ground
10	3V3	3.3 V power supply

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the *Function Switch*.

### GPIO Allocation Summary

ESP32-WROVER-B	IP101GRI	UART	JTAG	GPIO	Comments
S_VP				IO36	
S_VN				IO39	
IO34				IO34	
IO35				IO35	
IO32				IO32	
IO33				IO33	
IO25	RXD[0]				
IO26	RXD[1]				
IO27	CRS_DV

IO2				IO2	
IO0	REF_CLK				See note 1
IO4				IO4	
IO16				IO16 (NC)	See note 2
IO17				IO17 (NC)	See note 2
IO5	Reset_N				See note 1
IO18	MDIO				
IO19	TXD[0]				
IO21	TX_EN				
RXD0		RXD			
TXD0		TXD			
IO22	TXD[1]				
IO23	MDC				

#### Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET\_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET\_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET\_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET\_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see [ESP32-Ethernet-Kit V1.1 Ethernet board \(A\) schematic](#).
2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

### Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

## Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the [ethernet/ethernet](#) example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.1*.

## Summary of Changes from ESP32-Ethernet-Kit V1.0

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY's clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY's Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY's clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip's external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**ESP32-Ethernet-Kit V1.0 Getting Started Guide** This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

### What You Need

- *ESP32-Ethernet-Kit V1.0 board*
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview** ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B, The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

Fig. 26: ESP32-Ethernet-Kit V1.0

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

**Functionality Overview** The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

**Functional Description** The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Fig. 27: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 28: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)

**Ethernet Board (A)** The table below provides description starting from the picture' s top right corner and going clockwise.

Key Component	Description
ESP32-WROVER-B	This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.
GPIO Header 2	Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see <a href="#">GPIO Header 2</a> .
Flow Control	A jumper header with access to the board signals. For details, see <a href="#">Flow Control</a> .
Function Switch	A DIP switch used to configure the functionality of selected GPIOs of ESP32. For details, see <a href="#">Function Switch</a> .
Tx/Rx LEDs	Two LEDs to show the status of UART transmission.
GPIO Header 3	Provides access to some GPIOs of ESP32 that can be used depending on the position of the <a href="#">Function Switch</a> .
FT2232HL	The FT2232HL chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232HL also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232HL chip enhances user-friendliness in terms of application development and debugging. See <a href="#">ESP32-Ethernet-Kit V1.0 Ethernet board (A) schematic</a> .
USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Switch	Power On/Off Switch. Toggling toward the <b>Boot</b> button powers the board on, toggling away from <b>Boot</b> powers the board off.
5V Input	The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
5V Power On LED	This red LED turns on when power is supplied to the board, either from USB or 5V Input.
DC/DC Converter	Provided DC 5 V to 3.3 V conversion, output current up to 2A.
Board B Connectors	A pair male header pins for mounting the <a href="#">PoE board (B)</a> .
IP101GR	The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GR chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3 / 802.3u standard of 10/100Mbps.
RJ45 Port	Ethernet network data transmission port.
Magnetics Module	The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.
Link/Activity LEDs	Two LEDs (green and red) that respectively indicate the “Link” and “Activity” statuses of the PHY.
BOOT Button	Download button. Holding down <b>BOOT</b> and then pressing <b>CH_PU</b> initiates Firmware Download mode for downloading firmware through the serial port.
CH_PU Button	Reset button.

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under [Functionality Overview](#).

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

Fig. 29: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)

Key Component	Description
Board A Connector	Four female header pins for mounting this board onto <a href="#">Ethernet board (A)</a> .
External Power Terminals	Optional power supply to the PoE board (B).

**Setup Options** This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch** The functions for specific GPIO pins can be selected with the Function Switch.

DIP SW	GPIO Pin	Pin Functionality if DIP SW is ON
1	GPIO14	Connected to FT2232H to provide JTAG functionality
2	GPIO12	Connected to FT2232H to provide JTAG functionality
3	GPIO13	Connected to FT2232H to provide JTAG functionality
4	GPIO15	Connected to FT2232H to provide JTAG functionality
5	GPIO4	Connected to FT2232H to provide JTAG functionality
6	GPIO2	Connected to on-board 25 MHz oscillator
7	GPIO5	Connected to RESET_N input of IP101GRI
8	n/a	

You can make a certain GPIO pin available for other purposes by putting its DIP SW to the Off position.

**Flow Control** This is a 2 x 2 jumper pin header intended for the UART flow control.

.	Signal	Comment
1	MTDO	GPIO13, see also <a href="#">Function Switch</a>
2	MTCK	GPIO15, see also <a href="#">Function Switch</a>
3	RTS	RTS signal of FT2232H
4	CTS	CTS signal of FT2232H

**GPIO Allocation** This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface** The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

.	ESP32 Pin (MAC)	IP101GRI (PHY)
<i>RMII Interface</i>		
1	GPIO21	TX_EN
2	GPIO19	TXD[0]
3	GPIO22	TXD[1]
4	GPIO25	RXD[0]
5	GPIO26	RXD[1]
6	GPIO27	CRS_DV
7	GPIO0	REF_CLK
<i>Serial Management Interface</i>		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY Reset</i>		
10	GPIO5	Reset_N

**Note:** Except for REF\_CLK, the allocation of all pins under the *RMII Interface* is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1** This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

.	ESP32 Pin
1	GPIO32
2	GPIO33
3	GPIO34
4	GPIO35
5	GPIO36
6	GPIO39

**GPIO Header 2** This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see *IP101GRI (PHY) Interface*. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

.	ESP32 Pin	MII Function	Comments
1	GPIO17	EMAC_CLK_180	See note 1
2	GPIO16	EMAC_CLK_OUT	See note 1
3	GPIO4	EMAC_TX_ER	
4	GPIO2	n/a	See note 2
5	GPIO5	EMAC_RX_CLK	See note 2

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the *Function Switch*.

**GPIO Header 3** The functionality of GPIOs connected to this header depends on the settings of the *Function Switch*.

.	ESP32 Pin
1	GPIO15
2	GPIO13
3	GPIO12
4	GPIO14
5	GND
6	3V3

#### Note:

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

**Start Application Development** Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

## Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the *ethernet/ethernet* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.0 board*.

## 1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

### 1.4.1 Setting up Development Environment

- [Step 1. Install prerequisites for Windows, Linux or macOS](#)
- [Step 2. Get ESP-IDF](#)
- [Step 3. Set up the tools](#)
- [Step 4. Set up the environment variables](#)

### 1.4.2 Creating Your First Project

- [Step 5. Start a Project](#)
- [Step 6. Connect Your Device](#)
- [Step 7. Configure](#)
- [Step 8. Build the Project](#)
- [Step 9. Flash onto the Device](#)
- [Step 10. Monitor](#)

## 1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

## 1.5.1 Standard Setup of Toolchain for Windows

### Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use *Eclipse* or another graphical IDE with CMake support instead.

---

**Note:** Limitation: the installation path of Python or ESP-IDF must not contain white spaces or parentheses.

Limitation: the installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support. System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

---

### ESP-IDF Tools Installer

The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers from this URL: <https://dl.espressif.com/dl/esp-idf/?idf=4.1>

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

**Components of the installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option `Run ESP-IDF PowerShell Environment` or `Run ESP-IDF Command Prompt (cmd.exe)`. The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):

### Using the Command Prompt

For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF\_PATH and others). Inside this command prompt, all the installed tools are available.

Fig. 30: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

C:\Users\test\esp\esp-idf>
```

Fig. 33: ESP-IDF Command Prompt

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

## Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to [Step 5. Start a Project](#).

## Related Documents

For advanced users who want to customize the install process:

## Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to `PATH`.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

## 1.5.2 Standard Setup of Toolchain for Linux

### Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3-  
↳python3-pip python3-setuptools cmake ninja-build ccache
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-  
↳setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util
```

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja-  
↳ccache
```

---

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

### Fixing broken pip on Ubuntu 16.04

Package python3-pip could be broken without possibility to upgrade it. Package has to be removed and installed manually using script [get-pip.py](#):

```
apt remove python3-pip python3-virtualenv; rm -r ~/.local  
rm -r ~/.espressif/python_env && python get-pip.py
```

### Python 2 deprecation

Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.

### Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

## 1.5.3 Standard Setup of Toolchain for Mac OS

### Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:

```
sudo easy_install pip
```

- install CMake & Ninja build:

- If you have [HomeBrew](#), you can run:

```
brew install cmake ninja
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.

- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), -  
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Installing Python 3** Basing on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

### Python 2 deprecation

Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

### Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

## 1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

---

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

---

### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```
cd ~/esp
git clone -b release/v4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

### 1.6.2 Windows

In addition to installing the tools, [ESP-IDF Tools Installer](#) for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these [instructions](#).

## 1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

## 1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1
```

## 1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh
```

## 1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

---

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

---

### Windows

To prefer the Espressif download server when running the ESP-IDF Tools Installer or installing tools from the command line, open the System control panel, then click on Advanced Settings. Add a new Environment Variable (of type either User or System) with the name `IDF_GITHUB_ASSETS` and value `dl.espressif.com/github_assets`. Click OK once done.

If the command line window or ESP-IDF Tools Installer window was already open before you added the new environment variable, you will need to close and reopen it.

While this environment variable is still set, the ESP-IDF Tools Installer and the command line installer will prefer the Espressif download server.

### Linux and macOS

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

## 1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux and macOS, `%USERPROFILE%\espressif` on Windows. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

## 1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

### 1.8.1 Windows

*ESP-IDF Tools Installer* for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

### 1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
.$HOME/esp/esp-idf/export.sh
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the `esp-idf` environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

## 1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in IDF.

Copy `get-started/hello_world` to `~/esp` directory:

## 1.9.1 Linux and macOS

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

## 1.9.2 Windows

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

## 1.10 Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

## 1.11 Step 7. Configure

Navigate to your `hello_world` directory from [Step 5. Start a Project](#) and run the project configuration utility `menuconfig`.

### 1.11.1 Linux and macOS

```
cd ~/esp/hello_world
idf.py menuconfig
```

### 1.11.2 Windows

```
cd %userprofile%\esp\hello_world
idf.py menuconfig
```

If the previous steps have been done correctly, the following menu appears:

```

Espressif IoT Development Framework Configuration
Arrow keys navigate the menu. <Enter> selects submenus ---> (or empty submenus ----). Highlighted
letters are hotkeys. Pressing <Y> includes, <N> excludes, <M> modularizes features. Press <Esc><Esc>
to exit, <?> for Help, </> for Search. Legend: [*] built-in [ ] excluded <M> module < > module
capable

  SDK tool configuration --->
  Bootloader config --->
  Security features --->
  Serial flasher config --->
  Partition Table --->
  Optimization level (Debug) --->
  Component config --->

<Select> < Exit > < Help > < Save > < Load >

```

Fig. 34: Project configuration - Home window

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

To navigate and use `menuconfig`, press the following keys:

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen for menu or configuration item. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[\*]”
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the **ESP32-SOLO-1** module, enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing examples.

## 1.12 Step 8. Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello-world.bin

```

(continues on next page)

(continued from previous page)

```
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↳-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.
↳bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↳partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary `.bin` file.

## 1.13 Step 9. Flash onto the Device

Flash the binaries that you just built onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with your ESP32 board's serial port name from [Step 6. Connect Your Device](#).

You can also change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

```
Running esptool.py in directory [...]/esp/hello_world
Executing "python [...]/esp-idf/components/esptool_py/esptool/esptool.py -b 460800.
↳write_flash @flash_project_args"...
esptool.py -b 460800 write_flash --flash_mode dio --flash_size detect --flash_freq.
↳40m 0x1000 bootloader/bootloader.bin 0x8000 partition_table/partition-table.bi.
↳0x10000 hello-world.bin

(continues on next page)

(continued from previous page)

```
Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the module will be reset and the “hello\_world” application will be running.

## 1.14 Step 10. Monitor

To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_
↩world/build/hello-world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

```
e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to *menuconfig*.
3. Go to Component config → ESP32-specific → Main XTAL frequency, then change *CONFIG\_ESP32\_XTAL\_FREQ\_SEL* to 26MHz.
4. After that, *build and flash* the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of `idf.py` commands and options.

**That's all that you need to get started with ESP32!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

## 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

## 1.16 Related Documents

### 1.16.1 Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.

#### Connect ESP32 to PC

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the `{IDF_TARGET_NAME}` boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

#### Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

#### Check port on Linux and MacOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Fig. 35: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

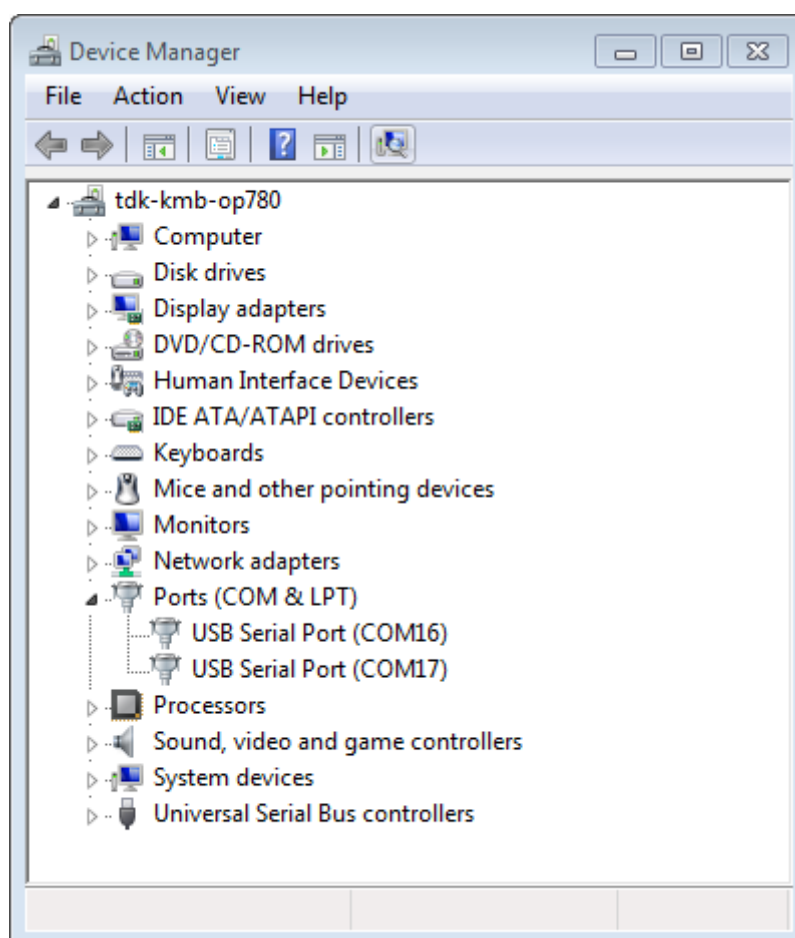

Fig. 36: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

## Linux

```
ls /dev/tty*
```

## MacOS

```
ls /dev/cu.*
```

---

**Note:** MacOS users: if you don't see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For MacOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

---

### Adding user to dialout on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

### Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun  8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
rst:0x7 (TGWDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

Fig. 37: Setting Serial Communication in PuTTY on Windows

Fig. 38: Setting Serial Communication in PuTTY on Linux

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

---

**Note:** Close serial terminal after verification that communication is working. In the next step we are going to use a different application to upload a new firmware to ESP32. This application will not be able to access serial port while it is open in terminal.

---

If you got here from *Step 6. Connect Your Device* when installing s/w for ESP32 development, then you can continue with *Step 7. Configure*.

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to <https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md> for further instructions.

If you require Eclipse IDE support for legacy ESP\_IDF Make build system, you can follow the *legacy GNU Make build system Getting Started guide* which has steps for *Building and Flashing with Eclipse IDE*.

### 1.16.3 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

For the legacy GNU Make system, run `make monitor`.

#### Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+] ]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+] ]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4\_\_\_\_\_, IDF Monitor uses [addr2line](#) to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

```

To decode each address, IDF Monitor runs the following command in the background:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Launching GDB with GDBStub** By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with [GDB](#) project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub, open the project configuration menu (`idf.py menuconfig`) and set [CONFIG\\_ESP32\\_PANIC](#) to Invoke GDBStub.

In this case, if the panic handler is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex.
↳ interrupt build/PROJECT.elf
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for [logging](#).

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the [logging library](#). Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples Of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

(continues on next page)

(continued from previous page)

```
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↵1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## Known Issues with IDF Monitor

### Issues Observed on Windows

- If in the Windows environment you receive the error “winpty: command not found”, fix it by running `pacman -S winpty`.
- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

## 1.16.4 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see [Step 3. Set up the tools](#)) you may build the toolchain yourself.

If you can't think of a reason why you need to build it yourself, then probably it's better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don't trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

### Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the [ESP-IDF Tools Installer](#) for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section [Standard Setup of Toolchain for Windows](#).

---

**Note:** The GNU Make based build system requires the [MSYS2](#) Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

---

### Get ESP-IDF

**Note:** Previous versions of ESP-IDF used the **MSYS2 bash terminal** command line. The current cmake-based build system can run in the regular **Windows Command Prompt** which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

---

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b release/v4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

---

**Note:** The `git clone` option `-b release/v4.1` tells git to clone the branch in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

---

**Note:** GitHub's "Download zip file" feature does not work with ESP-IDF, a `git clone` is required. As a fallback, [Stable version](#) can be installed without Git.

---

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

---

### Tools

**cmake** Download the latest stable release of [CMake](#) for Windows and run the installer.

When the installer asks for Install Options, choose either "Add CMake to the system PATH for all users" or "Add CMake to the system PATH for the current user" .

### Ninja build

**Note:** Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

---

Download the [ninja](#) latest stable Windows release from the ([download page](#)).

The Ninja for Windows download is a .zip file containing a single `ninja.exe` file which needs to be unzipped to a directory which is then [added to your Path](#) (or you can choose a directory which is already on your Path).

**Python** Download the latest [Python](#) for Windows installer, and run it.

The "Customise" step of the Python installer gives a list of options. The last option is "Add python.exe to Path" . Change this option to select "Will be installed" .

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

**Toolchain Setup** Download the precompiled Windows toolchain:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-win32.zip)

Unzip the zip file to C:\Program Files (or some other location). The zip file contains a single directory xtensa-esp32-elf.

Next, the bin subdirectory of this directory must be *added to your Path*. For example, the directory to add may be C:\Program Files\xtensa-esp32-elf\bin.

---

**Note:** If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory C:\msys32\opt\xtensa-esp32-elf\bin to the Path instead, as the toolchain is included in the MSYS2 environment.

---

**Adding Directory to Path** To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ; <new value>.

**Next Steps** To carry on with development environment setup, proceed to *Step 3. Set up the tools*.

### Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section *Standard Setup of Toolchain for Linux*.

---

**Note:** The reason you might need to build your own toolchain is to solve the Y2K38 problem (time\_t expand to 64 bits instead of 32 bits).

---

**Install Prerequisites** To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf_  
↳python3 python3-pip cmake ninja-build ccache
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-_  
↳pip python3-setuptools python3-serial python3-cryptography python3-future_  
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev_  
↳libssl-dev dfu-util
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial_  
↳python-cryptography python-future python-pyparsing python-pyelftools cmake_  
↳ninja ccache dfu-util
```

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .

---

### Compile the Toolchain from Source

- Install dependencies:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-  
↳devel automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 or newer:

```
sudo apt-get install gawk gperf grep gettext python python-dev automake  
↳bison flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

Create the working directory and go into it:

```
mkdir -p ~/esp  
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git  
cd crosstool-NG  
git checkout esp-2020r3  
git submodule update --init  
./bootstrap && ./configure --enable-local && make
```

---

**Note:** To create a toolchain with support for 64-bit `time_t`, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

---

Build the toolchain:

```
./ct-ng xtensa-esp32-elf  
./ct-ng build  
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32-elf`. Follow [instructions for standard setup](#) to add the toolchain to your PATH.

**Python 2 deprecation** Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.

**Next Steps** To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*.

### Setup Toolchain for Mac OS from Scratch

**Package Manager** To set up the toolchain from scratch, rather than *downloading a pre-compiled toolchain*, you will need to install either the [MacPorts](#) or [homebrew](#) package manager.

MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.

See *Customized Setup of Toolchain* section for some of the reasons why installing the toolchain from scratch may be necessary.

### Install Prerequisites

- install pip:

```
sudo easy_install pip
```

- install pyserial:

```
pip install --user pyserial
```

- install CMake & Ninja build:

- If you have HomeBrew, you can run:

```
brew install cmake ninja
```

- If you have MacPorts, you can run:

```
sudo port install cmake ninja
```

### Compile the Toolchain from Source

- Install dependencies:

- with MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool_↵  
↵autoconf automake make
```

- with homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man_↵  
↵libtool autoconf automake make
```

Create a case-sensitive filesystem image:

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_↵  
↵HFS+"
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp  
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download `crosstool-NG` and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`. To use it, you need to add `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin` to `PATH` environment variable.

**Python 2 deprecation** Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

**Next Steps** To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

## 1.16.5 Get Started (Legacy GNU Make)

---

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

This document is intended to help you set up the software development environment for the hardware based on Espressif ESP32.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then how to build and flash firmware onto an ESP32 board.

---

**Note:** This is documentation for branch `release/v4.1` of ESP-IDF. Other [ESP-IDF Versions](#) are also available.

---

### Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

## What You Need

Hardware:

- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

- **Toolchain** to build the **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
- **Text editor** to write programs (**Projects**) in C, e.g., [Eclipse](#)

Fig. 39: Development of applications for ESP32

## Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

## Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

## Setting up Development Environment

- *Step 1. Set up the Toolchain for Windows, Linux or macOS*
- *Step 2. Get ESP-IDF*
- *Step 3. Set Environment Variables*
- *Step 4. Install the Required Python Packages*

## Creating Your First Project

- [Step 5. Start a Project](#)
- [Step 6. Connect Your Device](#)
- [Step 7. Configure](#)
- [Step 8. Build and Flash](#)
- [Step 9. Monitor](#)

### Step 1. Set up the Toolchain

The toolchain is a set of programs for compiling code and building applications.

The quickest way to start development with ESP32 is by installing a prebuilt toolchain. Pick up your OS below and follow the provided instructions.

---

#### Standard Setup of Toolchain for Windows (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Introduction** Windows doesn't have a built-in "make" environment, so as well as installing the toolchain you will need a GNU-compatible environment. We use the [MSYS2](#) environment to provide this. You don't need to use this environment all the time (you can use [Eclipse](#) or some other front-end), but it runs behind the scenes.

**Toolchain Setup** The quick setup is to download the Windows all-in-one toolchain & MSYS2 zip file from [dl.espressif.com](https://dl.espressif.com):

[https://dl.espressif.com/dl/esp32\\_win32\\_msys2\\_environment\\_and\\_esp2020r2\\_toolchain-20200601.zip](https://dl.espressif.com/dl/esp32_win32_msys2_environment_and_esp2020r2_toolchain-20200601.zip)

Unzip the zip file to C:\ (or some other location, but this guide assumes C:\) and it will create an `msys32` directory with a pre-prepared environment.

---

**Important:** If another toolchain location is used (different than the default C:\msys32), please ensure that the path where the all-in-one toolchain gets unzipped is a plain ASCII, contains no spaces, symlinks or accents.

---

**Check it Out** Open a MSYS2 MINGW32 terminal window by running `C:\msys32\mingw32.exe`. The environment in this window is a bash shell. Create a directory named `esp` that is a default location to develop ESP32 applications. To do so, run the following shell command:

```
mkdir -p ~/esp
```

By typing `cd ~/esp` you can then move to the newly created directory. If there are no error messages you are done with this step.

Use this window in the following steps setting up development environment for ESP32.

**Next Steps** To carry on with development environment setup, proceed to section [Step 2. Get ESP-IDF](#).

**Updating The Environment** When IDF is updated, sometimes new toolchains are required or new requirements are added to the Windows MSYS2 environment. To move any data from an old version of the precompiled environment to a new one:

- Take the old MSYS2 environment (ie C:\msys32) and move/rename it to a different directory (ie C:\msys32\_old).
- Download the new precompiled environment using the steps above.

```

M ~/esp
Krzysztof@tdk-kmb-op780 MINGW32 ~
$ mkdir -p ~/esp
Krzysztof@tdk-kmb-op780 MINGW32 ~
$ cd ~/esp
Krzysztof@tdk-kmb-op780 MINGW32 ~/esp
$

```

Fig. 40: MSYS2 MINGW32 shell window

- Unzip the new MSYS2 environment to `C:\msys32` (or another location).
- Find the old `C:\msys32_old\home` directory and move this into `C:\msys32`.
- You can now delete the `C:\msys32_old` directory if you no longer need it.

You can have independent different MSYS2 environments on your system, as long as they are in different directories.

There are *also steps to update the existing environment without downloading a new one*, although this is more complex.

## Related Documents

### Setup Windows Toolchain from Scratch (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Setting up the environment gives you some more control over the process, and also provides the information for advanced users to customize the install. The *pre-built environment*, addressed to less experienced users, has been prepared by following these steps.

To quickly setup the toolchain in standard way, using a prebuilt environment, proceed to section *Standard Setup of Toolchain for Windows (Legacy GNU Make)*.

**Configure Toolchain & Environment from Scratch** This process involves installing **MSYS2**, then installing the **MSYS2** and Python packages which ESP-IDF uses, and finally downloading and installing the Xtensa toolchain.

- Navigate to the **MSYS2** installer page and download the `msys2-i686-xxxxxxx.exe` installer executable (we only support a 32-bit MSYS environment, it works on both 32-bit and 64-bit Windows.) At time of writing, the latest installer is `msys2-i686-20161025.exe`.
- Run through the installer steps. **Uncheck the “Run MSYS2 32-bit now” checkbox at the end.**
- Once the installer exits, open Start Menu and find “MSYS2 MinGW 32-bit” to run the terminal. (*Why launch this different terminal? MSYS2 has the concept of different kinds of environments. The default “MSYS” environment is Cygwin-like and uses a translation layer for all Windows API calls. We need the “MinGW” environment in order to have a native Python which supports COM ports.*)
- The ESP-IDF repository on github contains a script in the tools directory titled `windows_install_prerequisites.sh`. If you haven’t got a local copy of the ESP-IDF yet, that’s OK - you can just download that one file in Raw format from here: [tools/windows/windows\\_install\\_prerequisites.sh](https://github.com/espressif/esp-idf/blob/master/tools/windows/windows_install_prerequisites.sh). Save it somewhere on your computer.
- Type the path to the shell script into the MSYS2 terminal window. You can type it as a normal Windows path, but use forward-slashes instead of back-slashes. ie: `C:/Users/myuser/Downloads/windows_install_prerequisites.sh`. You can read the script beforehand to check what it does.
- The `windows_install_prerequisites.sh` script will download and install packages for ESP-IDF support, and the ESP32 toolchain.

## Troubleshooting

- While the install script runs, MSYS may update itself into a state where it can no longer operate. You may see errors like the following:

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408. This_
↪problem is probably due to using incompatible versions of the cygwin DLL.
```

If you see errors like this, close the terminal window entirely (terminating the processes running there) and then re-open a new terminal. Re-run `windows_install_prerequisites.sh` (tip: use the up arrow key to see the last run command). The update process will resume after this step.

- MSYS2 is a “rolling” distribution so running the installer script may install newer packages than what is used in the prebuilt environments. If you see any errors that appear to be related to installing MSYS2 packages, please check the [MSYS2-packages issues list](#) for known issues. If you don't see any relevant issues, please [raise an IDF issue](#).

**MSYS2 Mirrors in China** There are some (unofficial) MSYS2 mirrors inside China, which substantially improves download speeds inside China.

To add these mirrors, edit the following two MSYS2 mirrorlist files before running the setup script. The mirrorlist files can be found in the `/etc/pacman.d` directory (i.e. `c:\msys2\etc\pacman.d`).

Add these lines at the top of `mirrorlist.mingw32`:

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

Add these lines at the top of `mirrorlist.msys`:

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

**HTTP Proxy** You can enable an HTTP proxy for MSYS and PIP downloads by setting the `http_proxy` variable in the terminal before running the setup script:

```
export http_proxy='http://http.proxy.server:PORT'
```

Or with credentials:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

Add this line to `/etc/profile` in the MSYS directory in order to permanently enable the proxy when using MSYS.

**Alternative Setup: Just download a toolchain** If you already have an MSYS2 install or want to do things differently, you can download just the toolchain here:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-win32.zip)

---

**Note:** If you followed instructions *Configure Toolchain & Environment from Scratch*, you already have the toolchain and you won't need this download.

---

**Important:** Just having this toolchain is *not enough* to use ESP-IDF on Windows. You will need GNU make, bash, and sed at minimum. The above environments provide all this, plus a host compiler (required for menuconfig support).

---

**Next Steps** To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

**Updating The Environment** When IDF is updated, sometimes new toolchains are required or new system requirements are added to the Windows MSYS2 environment.

Rather than setting up a new environment, you can update an existing Windows environment & toolchain:

- Update IDF to the new version you want to use.
- Run the `tools/windows/windows_install_prerequisites.sh` script inside IDF. This will install any new software packages that weren't previously installed, and download and replace the toolchain with the latest version.

The script to update MSYS2 may also fail with the same errors mentioned under *Troubleshooting*.

If you need to support multiple IDF versions concurrently, you can have different independent MSYS2 environments in different directories. Alternatively you can download multiple toolchains and unzip these to different directories, then use the PATH environment variable to set which one is the default.

---

### Standard Setup of Toolchain for Linux (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Install Prerequisites** To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum install gcc git wget make flex bison gperf python python2-cryptography
```

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make flex bison gperf python python-pip  
↳python-setuptools python-serial python-cryptography python-future python-  
↳pyparsing python-pyelftools libffi-dev libssl-dev
```

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pyserial python-  
↳cryptography python-future python-pyparsing python-pyelftools
```

---

**Note:** Some older Linux distributions may be missing some of the Python packages listed above (or may use `pyserial` version 2.x which is not supported by ESP-IDF). It is possible to install these packages via `pip` instead - as described in section *Step 4. Install the Required Python Packages*.

---

**Toolchain Setup** ESP32 toolchain for Linux is available for download from Espressif website:

- for 64-bit Linux:  
[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-linux-amd64.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.tar.gz)
- for 32-bit Linux:  
[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-linux-i686.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-i686.tar.gz)

1. Download this file, then extract it in `~/esp` directory:

- for 64-bit Linux:

```
mkdir -p ~/esp  
cd ~/esp  
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.tar.  
↳gz
```

- for 32-bit Linux:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-i686.tar.gz
```

2. The toolchain will be extracted into `~/esp/xtensa-esp32-elf/` directory. To use it, you will need to update your `PATH` environment variable in `~/.profile` file. To make `xtensa-esp32-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

```
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your `~/.profile` file:

```
alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
```

Then when you need the toolchain you can type `get_esp32` on the command line and the toolchain will be added to your `PATH`.

---

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, alias should set in `.bashrc`.

---

3. Log off and log in back to make the `.profile` changes effective. Run the following command to verify if `PATH` is correctly set:

```
printenv PATH
```

You are looking for similar result containing toolchain's path at the beginning of displayed string:

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
↪local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↪games:/usr/local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

**Permission issues /dev/ttyUSB0** With some Linux distributions you may get the Failed to open port `/dev/ttyUSB0` error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

**Next Steps** To carry on with development environment setup, proceed to section [Step 2. Get ESP-IDF](#).

## Related Documents

### Setup Linux Toolchain from Scratch (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Note:** Standard process for installing the toolchain is described [here](#). See [Customized Setup of Toolchain](#) section for some of the reasons why installing the toolchain from scratch may be necessary.

---

**Install Prerequisites** To compile with ESP-IDF you need to get the following packages:

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python_
↪python-pip python-setuptools python-serial python-cryptography python-future_
↪python-pyparsing python-pyelftools libffi-dev libssl-dev (continues on next page)
```

(continued from previous page)

- Arch:

```
sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial_
↳python-cryptography python-future python-pyparsing python-pyelftools
```

**Note:** Some older (pre-2014) Linux distributions may use `pyserial` version 2.x which is not supported by ESP-IDF. In this case please install a supported version via `pip` as it is described in section [Step 4. Install the Required Python Packages](#).

### Compile the Toolchain from Source

- Install dependencies:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python python-devel_
↳automake bison flex texinfo help2man libtool
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳dev automake bison flex texinfo help2man libtool
```

- Ubuntu 16.04 or newer:

```
sudo apt-get install gawk gperf grep gettext python python-dev automake_
↳bison flex texinfo help2man libtool libtool-bin
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳dev automake bison flex texinfo help2man libtool libtool-bin
```

- Arch:

```
TODO
```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download `crosstool-NG` and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32-elf`. Follow [instructions for standard setup](#) to add the toolchain to your `PATH`.

**Next Steps** To carry on with development environment setup, proceed to section [Step 2. Get ESP-IDF](#).

### Standard Setup of Toolchain for Mac OS (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

#### Install Prerequisites

- install pip:

```
sudo easy_install pip
```

---

**Note:** pip will be used later for installing *the required Python packages*.

---

**Toolchain Setup** ESP32 toolchain for macOS is available for download from Espressif website:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-macos.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-macos.tar.gz)

Download this file, then extract it in ~/esp directory:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-macos.tar.gz
```

The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory.

To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Then when you need the toolchain you can type get\_esp32 on the command line and the toolchain will be added to your PATH.

**Next Steps** To carry on with development environment setup, proceed to section [Step 2. Get ESP-IDF](#).

#### Related Documents

### Setup Toolchain for Mac OS from Scratch (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Note:** Standard process for installing the toolchain is described [here](#). See [Customized Setup of Toolchain](#) section for some of the reasons why installing the toolchain from scratch may be necessary.

---

## Install Prerequisites

- install pip:

```
sudo easy_install pip
```

---

**Note:** pip will be used later for installing *the required Python packages*.

---

## Compile the Toolchain from Source

- Install dependencies:
  - Install either [MacPorts](#) or [homebrew](#) package manager. MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.
  - with MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool  
↪autoconf automake
```

- with homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man  
↪libtool autoconf automake
```

Create a case-sensitive filesystem image:

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive"  
↪HFS+
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp  
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git  
cd crosstool-NG  
git checkout esp-2020r3  
git submodule update --init  
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf  
./ct-ng build  
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`. Follow [instructions for standard setup](#) to add the toolchain to your PATH.

**Next Steps** To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

---

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

---

Depending on your experience and preferences, you may want to customize your environment instead of using a prebuilt toolchain. To set up the system your own way go to Section *Customized Setup of Toolchain (Legacy GNU Make)*.

## Step 2. Get ESP-IDF

Besides the toolchain, you also need ESP32-specific API (software libraries and source code). They are provided by Espressif in [ESP-IDF repository](#).

To get a local copy of ESP-IDF, navigate to your installation directory and clone the repository with `git clone`.

Open Terminal, and run the following commands:

```
cd ~/esp
git clone -b release/v4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

---

**Note:** The `git clone` option `-b release/v4.1` tells `git` to clone the branch in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

---

---

**Note:** GitHub's "Download zip file" feature does not work with ESP-IDF, a `git clone` is required. As a fallback, [Stable version](#) can be installed without Git.

---

---

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

---

### Step 3. Set Environment Variables

The toolchain uses the environment variable `IDF_PATH` to access the ESP-IDF directory. This variable should be set up on your computer, otherwise projects will not build.

These variables can be set temporarily (per session) or permanently. Please follow the instructions specific to [Windows](#), [Linux](#) and [macOS](#) in Section [Add IDF\\_PATH to User Profile \(Legacy GNU Make\)](#).

### Step 4. Install the Required Python Packages

The python packages required by ESP-IDF are located in `IDF_PATH/requirements.txt`. You can install them by running:

```
python -m pip install --user -r $IDF_PATH/requirements.txt
```

**Note:** Please check the version of the Python interpreter that you will be using with ESP-IDF. For this, run the command `python --version` and depending on the result, you might want to use `python3`, `python3.7` or similar instead of just `python`, e.g.:

```
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

### Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in IDF.

Copy [get-started/hello\\_world](#) to the `~/esp` directory:

#### Linux and macOS

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

#### Windows

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

---

**Important:** The esp-idf build system does not support spaces in the paths to either esp-idf or to projects.

---

### Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32 \(Legacy GNU Make\)](#) for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

## Step 7. Configure

Navigate to your `hello_world` directory from [Step 5. Start a Project](#) and run the project configuration utility `menuconfig`.

### Linux and macOS

```
cd ~/esp/hello_world
make menuconfig
```

### Windows

```
cd %userprofile%\esp\hello_world
make menuconfig
```

If the previous steps have been done correctly, the following menu appears:

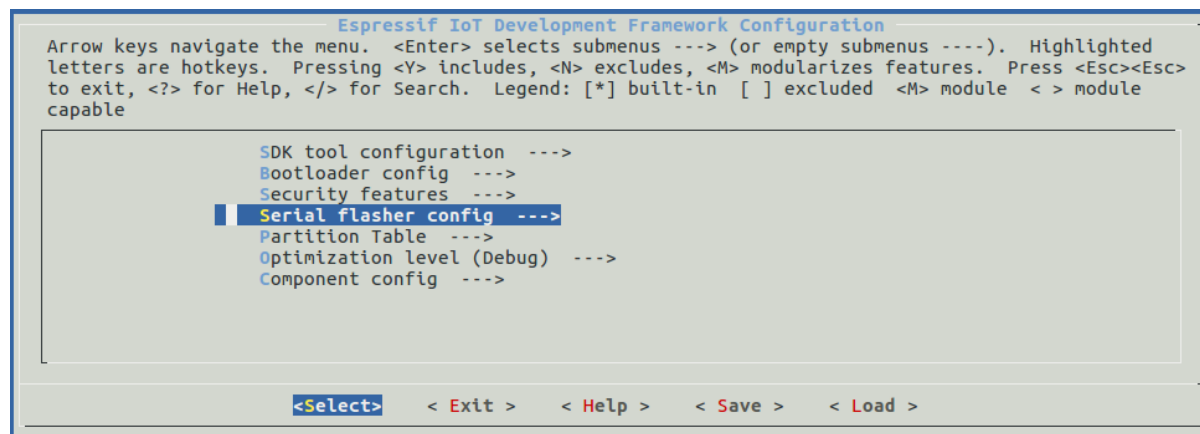

Fig. 41: Project configuration - Home window

In the menu, navigate to `Serial flasher config>Default serial port` to configure the serial port, where project will be loaded to. Confirm selection by pressing enter, save configuration by selecting `< Save >` and then exit `menuconfig` by selecting `< Exit >`.

To navigate and use `menuconfig`, press the following keys:

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[\*]”
- ? while highlighting a configuration item to display help about that item
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the **ESP32-SOLO-1** module, enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing examples.

## Step 8. Build and Flash

Build and flash the project by running:

```
make flash
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries. After that, these binaries will be flashed onto your ESP32 board.

If there are no issues by the end of the flash process, you will see messages (below) describing progress of the loading process. Then the board will be reset and the “hello\_world” application will start up.

```
esptool.py v2.0-beta2
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...
esptool.py v2.0-beta2

Leaving...
Hard resetting...
```

If you’d like to use the Eclipse IDE instead of running `make`, check out the [Eclipse guide](#).

## Step 9. Monitor

To check if “hello\_world” is indeed running, type `make monitor`.

This command launches the *IDF Monitor* application:

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

If IDF monitor fails shortly after the upload, or if instead of the messages above you see a random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

```
e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to [menuconfig](#).
3. Go to Component config → ESP32-specific → Main XTAL frequency, then change [CONFIG\\_ESP32\\_XTAL\\_FREQ\\_SEL](#) to 26MHz.
4. After that, [build and flash](#) the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
make flash monitor
```

See also [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.

### That's all that you need to get started with ESP32!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

### Environment Variables

Some environment variables can be specified whilst calling `make` allowing users to **override arguments without the need to reconfigure them using** `make menuconfig`.

Variables	Description & Usage
ESP-PORT	Overrides the serial port used in <code>flash</code> and <code>monitor</code> . Examples: <code>make flash ESPPORT=/dev/ttyUSB1</code> , <code>make monitor ESPPORT=COM1</code>
ESP-BAUD	Overrides the serial baud rate when flashing the ESP32. Example: <code>make flash ESPBAUD=9600</code>
MON-ITOR-BAUD	Overrides the serial baud rate used when monitoring. Example: <code>make monitor MONITORBAUD=9600</code>

**Note:** You can export environment variables (e.g. `export ESPPORT=/dev/ttyUSB1`). All subsequent calls of `make` within the same terminal session will use the exported value given that the variable is not simultaneously overridden.

## Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

If downloading to a new path, remember to [Add IDF\\_PATH to User Profile \(Legacy GNU Make\)](#) so that the toolchain scripts can find ESP-IDF in its release specific location.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

## Related Documents

### Add IDF\_PATH to User Profile (Legacy GNU Make)

---

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

To preserve setting of `IDF_PATH` environment variable between system restarts, add it to the user profile, following instructions below.

**Windows** The user profile scripts are contained in `C:/msys32/etc/profile.d/` directory. They are executed every time you open an MSYS2 window.

1. Create a new script file in `C:/msys32/etc/profile.d/` directory. Name it `export_idf_path.sh`.
2. Identify the path to ESP-IDF directory. It is specific to your system configuration and may look something like `C:\msys32\home\user-name\esp\esp-idf`
3. Add the `export` command to the script file, e.g.:

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

Remember to replace back-slashes with forward-slashes in the original Windows path.

4. Save the script file.
5. Close MSYS2 window and open it again. Check if `IDF_PATH` is set, by typing:

```
printenv IDF_PATH
```

The path previously entered in the script file should be printed out.

If you do not like to have `IDF_PATH` set up permanently in user profile, you should enter it manually on opening of an MSYS2 window:

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

If you got here from section [Step 3. Set Environment Variables](#), while installing s/w for ESP32 development, then go back to section [Step 5. Start a Project](#).

**Linux and MacOS** Set up `IDF_PATH` by adding the following line to `~/.profile` file:

```
export IDF_PATH=~/.esp/esp-idf
```

Log off and log in back to make this change effective.

---

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead.

---

Run the following command to check if `IDF_PATH` is set:

```
printenv IDF_PATH
```

The path previously entered in `~/.profile` file (or set manually) should be printed out.

If you do not like to have `IDF_PATH` set up permanently, you should enter it manually in terminal window on each restart or logout:

```
export IDF_PATH=~/.esp/esp-idf
```

If you got here from section *Step 3. Set Environment Variables*, while installing s/w for ESP32 development, then go back to section *Step 5. Start a Project*.

### Establish Serial Connection with ESP32 (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This section provides guidance how to establish serial connection between ESP32 and PC.

**Connect ESP32 to PC** Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 and other boards produced by Espressif:

Development Board	USB Driver	Remarks
<a href="#">ESP32-DevKitC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraT</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraTD-MSC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-PICO-KIT</a>	<a href="#">CP210x</a>	
<a href="#">ESP-WROVER-KIT</a>	<a href="#">FTDI</a>	
<a href="#">ESP32 Demo Board</a>	<a href="#">FTDI</a>	
<a href="#">ESP-Prog</a>	<a href="#">FTDI</a>	Programmer board (w/o ESP32)
<a href="#">ESP32-MeshKit-Sense</a>	n/a	Use with <a href="#">ESP-Prog</a>
<a href="#">ESP32-Sense Kit</a>	n/a	Use with <a href="#">ESP-Prog</a>

- [CP210x: CP210x USB to UART Bridge VCP Drivers](#)
- [FTDI: FTDI Virtual COM Port Drivers](#)

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check port on Linux and MacOS** To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

MacOS

Fig. 42: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

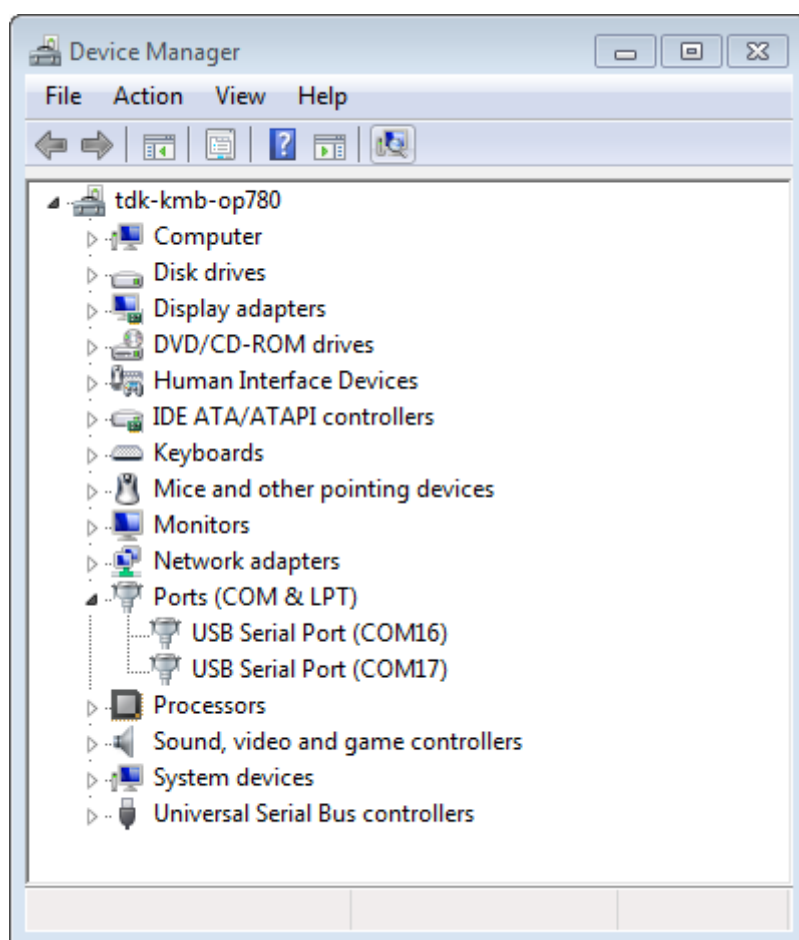

Fig. 43: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

```
ls /dev/cu.*
```

**Adding user to dialout on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection** Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 44: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

Fig. 45: Setting Serial Communication in PuTTY on Linux

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

If you see some legible log, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

**Note:** Close serial terminal after verification that communication is working. In next step we are going to use another application to upload ESP32. This application will not be able to access serial port while it is open in terminal.

---

If you got here from section [Step 6. Connect Your Device](#) when installing s/w for ESP32 development, then go back to section [Step 7. Configure](#).

### Build and Flash with Make (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Finding a project** As well as the [esp-idf-template](#) project, ESP-IDF comes with some example projects on github in the [examples](#) directory.

Once you've found the project you want to work with, change to its directory and you can configure and build it.

### Configuring your project

```
make menuconfig
```

### Compiling your project

```
make all
```

...will compile app, bootloader and generate a partition table based on the config.

**Flashing your project** When `make all` finishes, it will print a command line to use `esptool.py` to flash the chip. However you can also do this from `make` by running:

```
make flash
```

This will flash the entire project (app, bootloader and partition table) to a new chip. Also if partition table has `ota_data` then this command will flash a initial `ota_data`. It allows to run the newly loaded app from a factory partition (or the first OTA partition, if factory partition is not present). The settings for serial port flashing can be configured with `make menuconfig`.

You don't need to run `make all` before running `make flash`, `make flash` will automatically rebuild anything which needs it.

**Compiling & Flashing Just the App** After the initial flash, you may just want to build and flash just your app, not the bootloader and partition table:

- `make app` - build just the app.
- `make app-flash` - flash just the app.

`make app-flash` will automatically rebuild the app if it needs it.

There's no downside to reflashing the bootloader and partition table each time, if they haven't changed.

**The Partition Table** Once you've compiled your project, the "build" directory will contain a binary file with a name like "my\_app.bin". This is an ESP32 image binary that can be loaded by the bootloader.

A single ESP32's flash can contain multiple apps, as well as many kinds of data (calibration data, filesystems, parameter storage, etc). For this reason, a partition table is flashed to offset 0x8000 in the flash.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to `make menuconfig` and choose one of the simple predefined partition tables:

- "Single factory app, no OTA"
- "Factory app, two OTA definitions"

In both cases the factory app is flashed at offset 0x10000. If you `make partition_table` then it will print a summary of the partition table.

For more details about *partition tables* and how to create custom variations, view the *documentation*.

---

### Build and Flash with Eclipse IDE (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

**Installing Eclipse IDE** The Eclipse IDE gives you a graphical integrated development environment for writing, compiling and debugging ESP-IDF projects.

- Start by installing the esp-idf for your platform (see files in this directory with steps for Windows, OS X, Linux).
- We suggest building a project from the command line first, to get a feel for how that process works. You also need to use the command line to configure your esp-idf project (via `make menuconfig`), this is not currently supported inside Eclipse.
- Download the Eclipse Installer for your platform from [eclipse.org](http://eclipse.org).
- When running the Eclipse Installer, choose "Eclipse for C/C++ Development" (in other places you'll see this referred to as CDT.)

**Setting up Eclipse** Once your new Eclipse installation launches, follow these steps:

## Import New Project

- Eclipse makes use of the Makefile support in ESP-IDF. This means you need to start by creating an ESP-IDF project. You can use the idf-template project from github, or open one of the examples in the esp-idf examples subdirectory.
- Once Eclipse is running, choose File -> Import...
- In the dialog that pops up, choose “C/C++” -> “Existing Code as Makefile Project” and click Next.
- On the next page, enter “Existing Code Location” to be the directory of your IDF project. Don’t specify the path to the ESP-IDF directory itself (that comes later). The directory you specify should contain a file named “Makefile” (the project Makefile).
- On the same page, under “Toolchain for Indexer Settings” choose “Cross GCC” . Then click Finish.

## Project Properties

- The new project will appear under Project Explorer. Right-click the project and choose Properties from the context menu.
- Click on the “Environment” properties page under “C/C++ Build” . Click “Add...” and enter name BATCH\_BUILD and value 1.
- Click “Add...” again, and enter name IDF\_PATH. The value should be the full path where ESP-IDF is installed. Windows users can copy the IDF\_PATH from windows explorer.
- Edit the PATH environment variable. Keep the current value, and append the path to the Xtensa toolchain installed as part of IDF setup, if this is not already listed on the PATH. A typical path to the toolchain looks like /home/user-name/esp/xtensa-esp32-elf/bin. Note that you need to add a colon : before the appended path. Windows users will need to prepend C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin to PATH environment variable (If you installed msys32 to a different directory then you’ll need to change these paths to match).
- On macOS, add a PYTHONPATH environment variable and set it to /Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages. This is so that the system Python, which has pyserial installed as part of the setup steps, overrides any built-in Eclipse Python.

**ADDITIONAL NOTE:** If either the IDF\_PATH directory or the project directory is located outside C:\msys32\home directory, you will have to give custom build command in C/C++ Build properties as: `python ${IDF_PATH}/tools/windows/eclipse_make.py` (Please note that the build time may get significantly increased by this method.)

Navigate to “C/C++ General” -> “Preprocessor Include Paths” property page:

- Click the “Providers” tab
- In the list of providers, click “CDT Cross GCC Built-in Compiler Settings” . Change “Command to get compiler specs” to `xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "${INPUTS}”`.
- In the list of providers, click “CDT GCC Build Output Parser” and change the “Compiler command pattern” to `xtensa-esp32-elf-(gcc|g\+\+|c\+\+|cc|cpp|clang)`

Navigate to “C/C++ General” -> “Indexer” property page:

- Check “Enable project specific settings” to enable the rest of the settings on this page.
- Uncheck “Allow heuristic resolution of includes” . When this option is enabled Eclipse sometimes fails to find correct header directories.

Navigate to “C/C++ Build” -> “Behavior” property page:

- Check “Enable parallel build” to enable multiple build jobs in parallel.

**Building in Eclipse** Before your project is first built, Eclipse may show a lot of errors and warnings about undefined values. This is because some source files are automatically generated as part of the esp-idf build process. These errors and warnings will go away after you build the project.

- Click OK to close the Properties dialog in Eclipse.
- Outside Eclipse, open a command line prompt. Navigate to your project directory, and run `make menuconfig` to configure your project’s esp-idf settings. This step currently has to be run outside Eclipse.

*If you try to build without running a configuration step first, esp-idf will prompt for configuration on the command line - but Eclipse is not able to deal with this, so the build will hang or fail.*

- Back in Eclipse, choose Project -> Build to build your project.

**TIP:** If your project had already been built outside Eclipse, you may need to do a Project -> Clean before choosing Project -> Build. This is so Eclipse can see the compiler arguments for all source files. It uses these to determine the header include paths.

**Flash from Eclipse** You can integrate the “make flash” target into your Eclipse project to flash using esptool.py from the Eclipse UI:

- Right-click your project in Project Explorer (important to make sure you select the project, not a directory in the project, or Eclipse may find the wrong Makefile.)
- Select Build Targets -> Create... from the context menu.
- Type “flash” as the target name. Leave the other options as their defaults.
- Now you can use Project -> Build Target -> Build (Shift+F9) to build the custom flash target, which will compile and flash the project.

Note that you will need to use “make menuconfig” to set the serial port and other config options for flashing. “make menuconfig” still requires a command line terminal (see the instructions for your platform.)

Follow the same steps to add `bootloader` and `partition_table` targets, if necessary.

**Customized Setup of Toolchain (Legacy GNU Make)** Instead of downloading binary toolchain from Espressif website (see [Step 1. Set up the Toolchain](#)) you may build the toolchain yourself.

---

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

If you can't think of a reason why you need to build it yourself, then probably it's better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don't trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

# Chapter 2

## API Reference

### 2.1 Bluetooth API

#### 2.1.1 Controller & VHCI

##### Overview

##### Instructions

##### Application Example

Check `bluetooth/bluedroid/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/bluedroid/hci/controller\\_vhci\\_ble\\_adv](#).

##### API Reference

##### Header File

- `bt/include/esp_bt.h`

##### Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`

Set BLE TX power Connection Tx power should only be set after connection created.

**Return** ESP\_OK - success, other - failed

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

**Return**  $\geq 0$  - Power level,  $< 0$  - Invalid

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.

Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

*esp\_err\_t* **esp\_bredr\_tx\_power\_get** (*esp\_power\_level\_t* \*`min_power_level`, *esp\_power\_level\_t* \*`max_power_level`)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

*esp\_err\_t* **esp\_bredr\_sco\_datapath\_set** (*esp\_sco\_data\_path\_t* `data_path`)

set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `data_path`: SCO data path

*esp\_err\_t* **esp\_bt\_controller\_init** (*esp\_bt\_controller\_config\_t* \*`cfg`)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `cfg`: Initial configuration of BT controller. Different from previous version, there' s a mode and some connection configuration in “`cfg`” to configure controller work mode and allocate the resource which is needed.

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* `mode`)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `mode`: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “`cfg`” of `esp_bt_controller_init()`.

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable BT controller.

**Return** `ESP_OK` - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

bool **esp\_vhci\_host\_check\_send\_available** (void)

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

**Return** true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*data, uint16\_t len)  
esp\_vhci\_host\_send\_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- data: the packet point
- len: the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (const *esp\_vhci\_host\_callback\_t* \*callback)  
esp\_vhci\_host\_register\_callback register the vhci reference callback struct defined by vhci\_host\_callback structure.

**Return** ESP\_OK - success, ESP\_FAIL - failed

**Parameters**

- callback: *esp\_vhci\_host\_callback* type variable

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_controller\_mem\_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp\_bt\_controller\_mem\_release(mode) should be called only before esp\_bt\_controller\_init() or after esp\_bt\_controller\_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp\_bt\_controller\_enable(ESP\_BT\_MODE\_BLE) to use BLE only then it is safe to call esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_CLASSIC\_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP\_BT\_MODE\_BTDM, then it may be useful to call API esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM) instead, which internally calls esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp\_bt\_mem\_release() function

**Return** ESP\_OK - success, other - failed

**Parameters**

- mode: : the mode want to release memory

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_mem\_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp\_bt\_controller\_mem\_release(). Additionally, if the mode is set to ESP\_BT\_MODE\_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM) before esp\_bt\_controller\_init or after esp\_bt\_controller\_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP\_BT\_MODE\_BTDM as controller is dual mode.

**Return** ESP\_OK - success, other - failed

**Parameters**

- mode: : the mode whose memory is to be released

*esp\_err\_t* **esp\_bt\_sleep\_enable**(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp\_bt\_controller\_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG\_BTDM\_MODEM\_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp\_bt\_controller\_wakeup\_request” .

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush**(void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**

- ESP\_OK : success
- other : failed

## Structures

**struct esp\_bt\_controller\_config\_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

## Public Members

uint16\_t **controller\_task\_stack\_size**

Bluetooth controller task stack size

uint8\_t **controller\_task\_prio**

Bluetooth controller task priority

uint8\_t **hci\_uart\_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32\_t **hci\_uart\_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

`uint8_t scan_duplicate_mode`  
scan duplicate mode

`uint8_t scan_duplicate_type`  
scan duplicate type

`uint16_t normal_adv_size`  
Normal adv size for scan duplicate

`uint16_t mesh_adv_size`  
Mesh adv size for scan duplicate

`uint16_t send_adv_reserved_size`  
Controller minimum memory value

`uint32_t controller_debug_flag`  
Controller debug log flag

`uint8_t mode`  
Controller mode: BR/EDR, BLE or Dual Mode

`uint8_t ble_max_conn`  
BLE maximum connection numbers

`uint8_t bt_max_acl_conn`  
BR/EDR maximum ACL connection numbers

`uint8_t bt_sco_datapath`  
SCO data path, i.e. HCI or PCM module

`bool auto_latency`  
BLE auto latency, used to enhance classic BT performance

`bool bt_legacy_auth_vs_evt`  
BR/EDR Legacy auth complete event required to protect from BIAS attack

`uint8_t bt_max_sync_conn`  
BR/EDR maximum ACL connection numbers. Effective in menuconfig

`uint8_t ble_sca`  
BLE low power crystal accuracy index

`uint8_t pcm_role`  
PCM role (master & slave)

`uint8_t pcm_polar`  
PCM polar trig (falling clk edge & rising clk edge)

`bool hli`  
Using high level interrupt or not

`uint32_t magic`  
Magic number

**struct esp\_vhci\_host\_callback**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

`void (*notify_host_send_available)` (void)  
callback used to notify that the host can send packet to controller

`int (*notify_host_recv)` (uint8\_t \*data, uint16\_t len)  
callback used to notify that the controller has a packet to send to the host

## Macros

**ESP\_BT\_CONTROLLER\_CONFIG\_MAGIC\_VAL**  
**BT\_CONTROLLER\_INIT\_CONFIG\_DEFAULT** ()

## Type Definitions

**typedef struct esp\_vhci\_host\_callback esp\_vhci\_host\_callback\_t**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

## Enumerations

**enum esp\_bt\_mode\_t**  
Bluetooth mode for controller enable/disable.

*Values:*

**ESP\_BT\_MODE\_IDLE** = 0x00  
Bluetooth is not running

**ESP\_BT\_MODE\_BLE** = 0x01  
Run BLE mode

**ESP\_BT\_MODE\_CLASSIC\_BT** = 0x02  
Run Classic BT mode

**ESP\_BT\_MODE\_BTDM** = 0x03  
Run dual mode

**enum [anonymous]**

BLE sleep clock accuracy(SCA), values for ble\_sca field in *esp\_bt\_controller\_config\_t*, currently only ESP\_BLE\_SCA\_500PPM and ESP\_BLE\_SCA\_250PPM are supported.

*Values:*

**ESP\_BLE\_SCA\_500PPM** = 0  
BLE SCA at 500ppm

**ESP\_BLE\_SCA\_250PPM**  
BLE SCA at 250ppm

**ESP\_BLE\_SCA\_150PPM**  
BLE SCA at 150ppm

**ESP\_BLE\_SCA\_100PPM**  
BLE SCA at 100ppm

**ESP\_BLE\_SCA\_75PPM**  
BLE SCA at 75ppm

**ESP\_BLE\_SCA\_50PPM**  
BLE SCA at 50ppm

**ESP\_BLE\_SCA\_30PPM**  
BLE SCA at 30ppm

**ESP\_BLE\_SCA\_20PPM**  
BLE SCA at 20ppm

**enum esp\_bt\_controller\_status\_t**  
Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

**ESP\_BT\_CONTROLLER\_STATUS\_IDLE** = 0

**ESP\_BT\_CONTROLLER\_STATUS\_INITED**

**ESP\_BT\_CONTROLLER\_STATUS\_ENABLED**

**ESP\_BT\_CONTROLLER\_STATUS\_NUM**

**enum esp\_ble\_power\_type\_t**

BLE tx power type ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP\_BLE\_PWR\_TYPE\_ADV : for advertising/scan response. ESP\_BLE\_PWR\_TYPE\_SCAN : for scan. ESP\_BLE\_PWR\_TYPE\_DEFAULT : if each connection' s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP\_PWR\_LVL\_P3 as default for ADV/SCAN/CONN0-9.

*Values:*

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0** = 0  
For connection handle 0

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL1** = 1  
For connection handle 1

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL2** = 2  
For connection handle 2

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL3** = 3  
For connection handle 3

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4** = 4  
For connection handle 4

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5** = 5  
For connection handle 5

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6** = 6  
For connection handle 6

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7** = 7  
For connection handle 7

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8** = 8  
For connection handle 8

**ESP\_BLE\_PWR\_TYPE\_ADV** = 9  
For advertising

**ESP\_BLE\_PWR\_TYPE\_SCAN** = 10  
For scan

**ESP\_BLE\_PWR\_TYPE\_DEFAULT** = 11  
For default, if not set other, it will use default value

**ESP\_BLE\_PWR\_TYPE\_NUM** = 12  
TYPE numbers

**enum esp\_power\_level\_t**

Bluetooth TX power level(index), it' s just a index corresponding to power(dbm).

*Values:*

**ESP\_PWR\_LVL\_N12** = 0  
Corresponding to -12dbm

**ESP\_PWR\_LVL\_N9** = 1  
Corresponding to -9dbm

**ESP\_PWR\_LVL\_N6** = 2  
Corresponding to -6dbm

**ESP\_PWR\_LVL\_N3** = 3  
Corresponding to -3dbm

**ESP\_PWR\_LVL\_N0** = 4  
Corresponding to 0dbm

**ESP\_PWR\_LVL\_P3** = 5

Corresponding to +3dbm

**ESP\_PWR\_LVL\_P6** = 6

Corresponding to +6dbm

**ESP\_PWR\_LVL\_P9** = 7

Corresponding to +9dbm

**ESP\_PWR\_LVL\_N14** = [ESP\\_PWR\\_LVL\\_N12](#)

Backward compatibility! Setting to -14dbm will actually result to -12dbm

**ESP\_PWR\_LVL\_N11** = [ESP\\_PWR\\_LVL\\_N9](#)

Backward compatibility! Setting to -11dbm will actually result to -9dbm

**ESP\_PWR\_LVL\_N8** = [ESP\\_PWR\\_LVL\\_N6](#)

Backward compatibility! Setting to -8dbm will actually result to -6dbm

**ESP\_PWR\_LVL\_N5** = [ESP\\_PWR\\_LVL\\_N3](#)

Backward compatibility! Setting to -5dbm will actually result to -3dbm

**ESP\_PWR\_LVL\_N2** = [ESP\\_PWR\\_LVL\\_N0](#)

Backward compatibility! Setting to -2dbm will actually result to 0dbm

**ESP\_PWR\_LVL\_P1** = [ESP\\_PWR\\_LVL\\_P3](#)

Backward compatibility! Setting to +1dbm will actually result to +3dbm

**ESP\_PWR\_LVL\_P4** = [ESP\\_PWR\\_LVL\\_P6](#)

Backward compatibility! Setting to +4dbm will actually result to +6dbm

**ESP\_PWR\_LVL\_P7** = [ESP\\_PWR\\_LVL\\_P9](#)

Backward compatibility! Setting to +7dbm will actually result to +9dbm

**enum esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

**ESP\_SCO\_DATA\_PATH\_HCI** = 0

data over HCI transport

**ESP\_SCO\_DATA\_PATH\_PCM** = 1

data over PCM interface

## 2.1.2 BT COMMON

### BT GENERIC DEFINES

**Overview** [Instructions](#)

**Application Example** [Instructions](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_defs.h](#)

#### Structures

**struct esp\_bt\_uuid\_t**

UUID type.

### Public Members

**uint16\_t len**  
UUID length, 16bit, 32bit or 128bit

**union *esp\_bt\_uuid\_t*::[anonymous] uuid**  
UUID

### Macros

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTET8\_LEN**

**ESP\_DEFAULT\_GATT\_IF**  
Default GATT interface id.

**ESP\_BLE\_CONN\_INT\_MIN**  
relate to BTM\_BLE\_CONN\_INT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_INT\_MAX**  
relate to BTM\_BLE\_CONN\_INT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_LATENCY\_MAX**  
relate to ESP\_BLE\_CONN\_LATENCY\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**  
relate to BTM\_BLE\_CONN\_SUP\_TOUT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**  
relate to ESP\_BLE\_CONN\_SUP\_TOUT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_PARAM\_UNDEF**

**ESP\_BLE\_SCAN\_PARAM\_UNDEF**

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)  
Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**  
Bluetooth address length.

**ESP\_BLE\_ENC\_KEY\_MASK**  
Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**  
Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**  
Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**  
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**  
Minimum of the application id.

**ESP\_APP\_ID\_MAX**  
Maximum of the application id.

**ESP\_BD\_ADDR\_STR**

**ESP\_BD\_ADDR\_HEX** (addr)

### Type Definitions

```

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

**Functions***esp\_err\_t* **esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

**Return** Bluetooth stack status*esp\_err\_t* **esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init()

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit()

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**

- ESP\_OK : Succeed
- Other : Failed

**Enumerations****enum esp\_btdev\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

**ESP\_BTDEV\_STATUS\_UNINITIALIZED** = 0

Bluetooth not initialized

**ESP\_BTDEV\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

**ESP\_BTDEV\_STATUS\_ENABLED**

Bluetooth initialized and enabled

**BT DEVICE APIs**

**Overview** Bluetooth device reference APIs.

[Instructions](#)

**API Reference****Header File**

- [bt/host/bluetooth/api/include/api/esp\\_bt\\_device.h](#)

**Functions**

**const** uint8\_t \***esp\_bt\_dev\_get\_address** (void)

Get bluetooth device address. Must use after “esp\_btdev\_enable” .

**Return** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp\_err\_t* **esp\_bt\_dev\_set\_device\_name** (**const** char \**name*)

Set bluetooth device name. This function should be called after esp\_btdev\_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

**Parameters**

- [in] name: : device name to be set

**2.1.3 BT LE****GAP API**

**Overview** [Instructions](#)

**Application Example** Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.

## API Reference

### Header File

- `bt/host/bluedroid/api/include/api/esp_gap_ble_api.h`

### Functions

`esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)`

This function is called to occur gap event, such as scan result.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `callback`: callback function

`esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)`

This function is called to override the BTA default ADV parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `adv_data`: Pointer to User defined ADV data structure. This memory space can not be freed until callback of `config_adv_data` is received.

`esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)`

This function is called to set scan parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `scan_params`: Pointer to User defined `scan_params` data structure. This memory space can not be freed until callback of `set_scan_params`

`esp_err_t esp_ble_gap_start_scanning(uint32_t duration)`

This procedure keep the device scanning the peer device which advertising on the air.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `duration`: Keeping the scanning time, the unit is second.

`esp_err_t esp_ble_gap_stop_scanning(void)`

This function call to stop the device scanning the peer device which advertising on the air.

#### Return

- ESP\_OK : success

– other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] adv\_params: pointer to User defined adv\_params data structure.

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] params: - connection update parameters

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, uint16\_t tx\_data\_length)

This function is to set maximum LE data packet size.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] rand\_addr: the random address which should be setting

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy on the local device.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] privacy\_enable: - enable/disable privacy on remote device.

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t icon)

set local gap appearance icon

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `icon`: - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml>

`esp_err_t esp_ble_gap_update_whitelist` (bool `add_remove`, `esp_bd_addr_t` `remote_bda`, `esp_ble_wl_addr_type_t` `wl_addr_type`)

Add or remove device from white list.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `add_remove`: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] `remote_bda`: the remote device address add/remove from the white list.
- [in] `wl_addr_type`: whitelist address type

`esp_err_t esp_ble_gap_clear_whitelist` (void)

Clear all white list.

**Return**

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_get_whitelist_size` (uint16\_t \*`length`)

Get the whitelist size in the controller.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [out] `length`: the white list length.

`esp_err_t esp_ble_gap_set_prefer_conn_params` (`esp_bd_addr_t` `bd_addr`, uint16\_t `min_conn_int`, uint16\_t `max_conn_int`, uint16\_t `slave_latency`, uint16\_t `supervision_tout`)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peripheral
- [in] `min_conn_int`: minimum preferred connection interval
- [in] `max_conn_int`: maximum preferred connection interval
- [in] `slave_latency`: preferred slave latency
- [in] `supervision_tout`: preferred supervision timeout

`esp_err_t esp_ble_gap_set_device_name` (const char \*`name`)

Set device name to the local device.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `name`: - device name.

`esp_err_t esp_ble_gap_get_local_used_addr` (`esp_bd_addr_t` `local_used_addr`, uint8\_t \*`addr_type`)

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] local\_used\_addr: - current local used ble address (six bytes)
- [in] addr\_type: - ble address type

uint8\_t \*esp\_ble\_resolve\_adv\_data (uint8\_t \*adv\_data, uint8\_t type, uint8\_t \*length)

This function is called to get ADV data for a specific type.

**Return** pointer of ADV data

**Parameters**

- [in] adv\_data: - pointer of ADV data which to be resolved
- [in] type: - finding ADV data type
- [out] length: - return the length of ADV data not including type

esp\_err\_t esp\_ble\_gap\_config\_adv\_data\_raw (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw advertising data
- [in] raw\_data\_len: : raw advertising data length , less than 31 bytes

esp\_err\_t esp\_ble\_gap\_config\_scan\_rsp\_data\_raw (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw scan response data
- [in] raw\_data\_len: : raw scan response data length , less than 31 bytes

esp\_err\_t esp\_ble\_gap\_read\_rssi (esp\_bd\_addr\_t remote\_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] remote\_addr: : The remote connection device address.

esp\_err\_t esp\_ble\_gap\_add\_duplicate\_scan\_exceptional\_device (esp\_ble\_duplicate\_exceptional\_info\_type\_t type, esp\_duplicate\_info\_t device\_info)

This function is called to add a device info into the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] type: device info type, it is defined in esp\_ble\_duplicate\_exceptional\_info\_type\_t when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

*esp\_err\_t* **esp\_ble\_gap\_remove\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] type: device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

*esp\_err\_t* **esp\_ble\_gap\_clean\_duplicate\_scan\_exceptional\_list** (*esp\_duplicate\_scan\_exceptional\_list\_type\_t* list\_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] list\_type: duplicate scan exceptional list type, the value can be one or more of *esp\_duplicate\_scan\_exceptional\_list\_type\_t*.

*esp\_err\_t* **esp\_ble\_gap\_set\_security\_param** (*esp\_ble\_sm\_param\_t* param\_type, void \*value, uint8\_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’ .

To accept only secure connection mode, it is necessary do as following:

1. Set bit ESP\_LE\_AUTH\_REQ\_SC\_ONLY (param\_type is ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE), bit ESP\_LE\_AUTH\_BOND and bit ESP\_LE\_AUTH\_REQ\_MITM is optional as required.
2. Set to ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE (param\_type is ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH).

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] param\_type: : the type of the param which to be set
- [in] value: : the param value
- [in] len: : the length of the param value

*esp\_err\_t* **esp\_ble\_gap\_security\_rsp** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Grant security request access.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : BD address of the peer
- [in] accept: : accept the security request or not

*esp\_err\_t* **esp\_ble\_set\_encryption** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_sec\_act\_t* sec\_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : the address of the peer device need to encryption

- [in] `sec_act`: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

*esp\_err\_t* **esp\_ble\_passkey\_reply** (*esp\_bd\_addr\_t* `bd_addr`, bool `accept`, uint32\_t `passkey`)

Reply the key value to the peer device in the legacy connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* `bd_addr`, bool `accept`)

Reply the confirm value to the peer device in the secure connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* `bd_addr`)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** -  $\geq 0$  : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*`dev_num`, *esp\_ble\_bond\_dev\_t* \*`dev_list`)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [inout] `dev_num`: Indicate the `dev_list` array(buffer) size as input. If `dev_num` is large enough, it means the actual number as output. Suggest that `dev_num` value equal to `esp_ble_get_bond_device_num()`.
- [out] `dev_list`: an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* `bd_addr`, uint8\_t \*`TK`, uint8\_t `len`)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peer device.
- [in] `TK`: TK value, the TK value shall be a 128-bit random number
- [in] `len`: length of tk, should always be 128-bit

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* `remote_device`)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple `app_id` registered. `esp_ble_gattc_close` (*esp\_gatt\_if\_t* `gattc_if`, uint16\_t

conn\_id) only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device) disconnect the physical connection directly.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] remote\_device: : BD address of the peer device

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] conn\_params: the connection parameters information

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels\_t* channels)

BLE set channels.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] channels: : The n<sup>th</sup> such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

## Unions

**union esp\_ble\_key\_value\_t**

The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

### Structures

**struct esp\_ble\_adv\_params\_t**  
Advertising parameters.

### Public Members

**uint16\_t adv\_int\_min**  
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

**uint16\_t adv\_int\_max**  
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

*esp\_ble\_adv\_type\_t* **adv\_type**  
Advertising type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
Owner bluetooth device address type

*esp\_bd\_addr\_t* **peer\_addr**  
Peer device bluetooth device address

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**  
Peer device bluetooth device address type, only support public address type and random address type

*esp\_ble\_adv\_channel\_t* **channel\_map**  
Advertising channel map

*esp\_ble\_adv\_filter\_t* **adv\_filter\_policy**  
Advertising filter policy

**struct esp\_ble\_adv\_data\_t**  
Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

### Public Members

bool **set\_scan\_rsp**  
Set this advertising data as scan response or not

bool **include\_name**  
Advertising data include device name or not

bool **include\_txpower**  
Advertising data include TX power

int **min\_interval**  
Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$  **Conn\\_Interval\\_Min** range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max\_interval**  
Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$  **Conn\\_Interval\\_Max** range: 0x0006 to 0x0C80 **Conn\\_Interval\\_Max** shall be equal to or greater than the **Conn\\_Interval\\_Min**. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**  
External appearance of device

uint16\_t **manufacturer\_len**  
Manufacturer data length

uint8\_t \***p\_manufacturer\_data**  
Manufacturer data point

uint16\_t **service\_data\_len**  
Service data length

uint8\_t \***p\_service\_data**  
Service data point

uint16\_t **service\_uuid\_len**  
Service uuid length

uint8\_t \***p\_service\_uuid**  
Service uuid array point

uint8\_t **flag**  
Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

**struct esp\_ble\_scan\_params\_t**

Ble scan parameters.

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp\_gap\_conn\_params\_t**

connection parameters information

**Public Members**uint16\_t **interval**

connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_conn\_update\_params\_t**

Connection update parameters.

**Public Members***esp\_bd\_addr\_t* **bda**

Bluetooth device address

uint16\_t **min\_int**

Min connection interval

uint16\_t **max\_int**

Max connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_pkt\_data\_length\_params\_t**

BLE pkt data length keys.

**Public Members****uint16\_t rx\_len**

pkt rx data length value

**uint16\_t tx\_len**

pkt tx data length value

**struct esp\_ble\_penc\_keys\_t**

BLE encryption keys.

**Public Members***esp\_bt\_octet16\_t ltk*

The long term key

*esp\_bt\_octet8\_t rand*

The random number

**uint16\_t ediv**

The ediv value

**uint8\_t sec\_level**

The security level of the security link

**uint8\_t key\_size**

The key size(7~16) of the security link

**struct esp\_ble\_pcsrkeys\_t**

BLE CSRK keys.

**Public Members****uint32\_t counter**

The counter

*esp\_bt\_octet16\_t csrkey*

The csrkey

**uint8\_t sec\_level**

The security level

**struct esp\_ble\_pidkeys\_t**

BLE pid keys.

**Public Members***esp\_bt\_octet16\_t irk*

The irk value

*esp\_ble\_addr\_type\_t addr\_type*

The address type

*esp\_bd\_addr\_t static\_addr*

The static address

**struct esp\_ble\_lenc\_keys\_t**  
BLE Encryption reproduction keys.

#### Public Members

*esp\_bt\_octet16\_t* **ltk**  
The long term key

uint16\_t **div**  
The div value

uint8\_t **key\_size**  
The key size of the security link

uint8\_t **sec\_level**  
The security level of the security link

**struct esp\_ble\_lcsrk\_keys**  
BLE SRK keys.

#### Public Members

uint32\_t **counter**  
The counter value

uint16\_t **div**  
The div value

uint8\_t **sec\_level**  
The security level of the security link

*esp\_bt\_octet16\_t* **csrk**  
The csrk key value

**struct esp\_ble\_sec\_key\_notif\_t**  
Structure associated with ESP\_KEY\_NOTIF\_EVT.

#### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

uint32\_t **passkey**  
the numeric value for comparison. If just\_works, do not show this number to UI

**struct esp\_ble\_sec\_req\_t**  
Structure of the security request.

#### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

**struct esp\_ble\_bond\_key\_info\_t**  
struct type of the bond key information value

**Public Members**

*esp\_ble\_key\_mask\_t* **key\_mask**  
the key mask to indicate witch key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**  
received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrk\_key**  
received peer device SRK

*esp\_ble\_pid\_keys\_t* **pid\_key**  
peer device ID key

**struct esp\_ble\_bond\_dev\_t**  
struct type of the bond device value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**  
the bond key information

**struct esp\_ble\_key\_t**  
union type of the security key value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_key\_type\_t* **key\_type**  
key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**  
the pointer to the key value

**struct esp\_ble\_local\_id\_keys\_t**  
structure type of the ble local id keys value

**Public Members**

*esp\_bt\_octet16\_t* **ir**  
the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**  
the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**  
the 16 bits of the dh key value

**struct esp\_ble\_auth\_cmpl\_t**  
Structure associated with ESP\_AUTH\_CMPL\_EVT.

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
BD address peer device.

bool **key\_present**  
Valid link key value in key element

*esp\_link\_key* **key**  
Link key associated with peer device.

uint8\_t **key\_type**  
The type of Link Key

bool **success**  
TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**  
The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**  
Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**  
Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**  
authentication mode

### Macros

**ESP\_BLE\_ADV\_FLAG\_LIMIT\_DISC**  
BLE\_ADV\_DATA\_FLAG data flag bit definition used for advertising data flag

**ESP\_BLE\_ADV\_FLAG\_GEN\_DISC**

**ESP\_BLE\_ADV\_FLAG\_BREDR\_NOT\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_CONTROLLER\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_HOST\_SPT**

**ESP\_BLE\_ADV\_FLAG\_NON\_LIMIT\_DISC**

**ESP\_GAP\_BLE\_ADD\_WHITELIST\_COMPLETE\_EVT**  
    This is the old name, just for backwards compatibility.  
**ESP\_BLE\_ADV\_DATA\_LEN\_MAX**  
    Advertising data maximum length.  
**ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX**  
    Scan response data maximum length.  
**BLE\_BIT** (n)

### Type Definitions

**typedef** uint8\_t **esp\_ble\_key\_type\_t**

**typedef** uint8\_t **esp\_ble\_auth\_req\_t**

combination of the above bit pattern

**typedef** uint8\_t **esp\_ble\_io\_cap\_t**

combination of the io capability

**typedef** uint8\_t **esp\_gap\_ble\_channels**[ESP\_GAP\_BLE\_CHANNELS\_LEN]

**typedef** uint8\_t **esp\_duplicate\_info\_t**[ESP\_BD\_ADDR\_LEN]

**typedef** void (\***esp\_gap\_ble\_cb\_t**) (*esp\_gap\_ble\_cb\_event\_t* event, *esp\_ble\_gap\_cb\_param\_t* \*param)

GAP callback function type.

#### Parameters

- event: : Event type
- param: : Point to callback parameter, currently is union type

### Enumerations

**enum** **esp\_gap\_ble\_cb\_event\_t**

GAP BLE callback event type.

*Values:*

**ESP\_GAP\_BLE\_ADV\_DATA\_SET\_COMPLETE\_EVT** = 0

When advertising data set complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

When scan response data set complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_PARAM\_SET\_COMPLETE\_EVT**

When scan parameters set complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT**

When one scan result ready, the event comes each time

**ESP\_GAP\_BLE\_ADV\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

**ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT**

When starting advertising complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT**

When starting scan complete, the event comes

**ESP\_GAP\_BLE\_AUTH\_CMPL\_EVT**

Authentication complete indication.

**ESP\_GAP\_BLE\_KEY\_EVT**

BLE key event for peer device keys

**ESP\_GAP\_BLE\_SEC\_REQ\_EVT**

BLE security request

**ESP\_GAP\_BLE\_PASSKEY\_NOTIF\_EVT**

passkey notification event

**ESP\_GAP\_BLE\_PASSKEY\_REQ\_EVT**

passkey request event

**ESP\_GAP\_BLE\_OOB\_REQ\_EVT**

OOB request event

**ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**  
BLE local IR event

**ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**  
BLE local ER event

**ESP\_GAP\_BLE\_NC\_REQ\_EVT**  
Numeric Comparison request event

**ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**  
When stopping adv complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**  
When stopping scan complete, the event comes

**ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT**  
When setting the static rand address complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**  
When updating connection parameters complete, the event comes

**ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**  
When setting pkt length complete, the event comes

**ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**  
When enabling/disabling privacy on the local device complete, the event comes

**ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**  
When removing the bond device complete, the event comes

**ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**  
When clearing the bond device clear complete, the event comes

**ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**  
When getting the bond device list complete, the event comes

**ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**  
When reading the rssi complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**  
When adding or removing whitelist complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**  
When updating duplicate exceptional list complete, the event comes

**ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT**  
When setting BLE channels complete, the event comes

**ESP\_GAP\_BLE\_EVT\_MAX**

**enum esp\_ble\_adv\_data\_type**  
The type of advertising data(not adv\_type)

*Values:*

**ESP\_BLE\_AD\_TYPE\_FLAG** = 0x01

**ESP\_BLE\_AD\_TYPE\_16SRV\_PART** = 0x02

```

```
enum esp_ble_adv_type_t
```

Advertising mode.

*Values:*

```
ADV_TYPE_IND = 0x00
ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04
```

```
enum esp_ble_adv_channel_t
```

Advertising channel mask.

*Values:*

```
ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02
```

**ADV\_CHNL\_39** = 0x04

**ADV\_CHNL\_ALL** = 0x07

**enum esp\_ble\_adv\_filter\_t**

*Values:*

**ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_ANY** = 0x00

Allow both scan and connection requests from anyone.

**ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_ANY**

Allow both scan req from White List devices only and connection req from anyone.

**ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_WLST**

Allow both scan req from anyone and connection req from White List devices only.

**ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_WLST**

Allow scan and connection requests from White List devices only.

**enum esp\_ble\_sec\_act\_t**

*Values:*

**ESP\_BLE\_SEC\_ENCRYPT** = 1

**ESP\_BLE\_SEC\_ENCRYPT\_NO\_MITM**

**ESP\_BLE\_SEC\_ENCRYPT\_MITM**

**enum esp\_ble\_sm\_param\_t**

*Values:*

**ESP\_BLE\_SM\_PASSKEY** = 0

**ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE**

**ESP\_BLE\_SM\_IOCAP\_MODE**

**ESP\_BLE\_SM\_SET\_INIT\_KEY**

**ESP\_BLE\_SM\_SET\_RSP\_KEY**

**ESP\_BLE\_SM\_OOB\_SUPPORT**

**ESP\_BLE\_APP\_ENC\_KEY\_SIZE**

**ESP\_BLE\_SM\_MAX\_PARAM**

**enum esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

**BLE\_SCAN\_TYPE\_PASSIVE** = 0x0

Passive scan

**BLE\_SCAN\_TYPE\_ACTIVE** = 0x1

Active scan

**enum esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:*

**BLE\_SCAN\_FILTER\_ALLOW\_ALL** = 0x0

Accept all :

1. advertisement packets except directed advertising packets not addressed to this device (default).

**BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST** = 0x1

Accept only :

1. advertisement packets from devices where the advertiser' s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

**BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR** = 0x2

Accept all :

1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_PRA\_DIR** = 0x3

Accept all :

1. advertisement packets from devices where the advertiser' s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**enum esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:*

**BLE\_SCAN\_DUPLICATE\_DISABLE** = 0x0

the Link Layer should generate advertising reports to the host for each packet received

**BLE\_SCAN\_DUPLICATE\_ENABLE** = 0x1

the Link Layer should filter out duplicate advertising reports to the Host

**BLE\_SCAN\_DUPLICATE\_MAX** = 0x2

0x02 –0xFF, Reserved for future use

**enum esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:*

**ESP\_GAP\_SEARCH\_INQ\_RES\_EVT** = 0

Inquiry result for a peer device.

**ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT** = 1

Inquiry complete.

**ESP\_GAP\_SEARCH\_DISC\_RES\_EVT** = 2

Discovery result for a peer device.

**ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT** = 3

Discovery result for BLE GATT based service on a peer device.

**ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT** = 4

Discovery complete.

**ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT** = 5

Discovery complete.

**ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT** = 6

Search cancelled

**ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT** = 7

The number of pkt discarded by flow control

**enum esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

- ESP\_BLE\_EVT\_CONN\_ADV** = 0x00  
Connectable undirected advertising (ADV\_IND)
- ESP\_BLE\_EVT\_CONN\_DIR\_ADV** = 0x01  
Connectable directed advertising (ADV\_DIRECT\_IND)
- ESP\_BLE\_EVT\_DISC\_ADV** = 0x02  
Scannable undirected advertising (ADV\_SCAN\_IND)
- ESP\_BLE\_EVT\_NON\_CONN\_ADV** = 0x03  
Non connectable undirected advertising (ADV\_NONCONN\_IND)
- ESP\_BLE\_EVT\_SCAN\_RSP** = 0x04  
Scan Response (SCAN\_RSP)

**enum esp\_ble\_wl\_opration\_t**

*Values:*

- ESP\_BLE\_WHITELIST\_REMOVE** = 0X00  
remove mac from whitelist
- ESP\_BLE\_WHITELIST\_ADD** = 0X01  
add address to whitelist

**enum esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD** = 0  
Add device info into duplicate scan exceptional list
- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**  
Remove device info from duplicate scan exceptional list
- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**  
Clean duplicate scan exceptional list

**enum esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR** = 0  
BLE advertising address, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**  
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**  
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**  
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**  
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

**enum esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST** = BLE\_BIT(0)  
duplicate scan exceptional addr list
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST** = BLE\_BIT(1)  
duplicate scan exceptional mesh link ID list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST** = BLE\_BIT(2)  
duplicate scan exceptional mesh beacon type list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST** = BLE\_BIT(3)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST** = BLE\_BIT(4)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST** = 0xFFFF  
duplicate scan exceptional all list

*esp\_bt\_uuid\_t* **uuid**  
UUID

uint8\_t **inst\_id**  
Instance id

**struct esp\_gatt\_srvc\_id\_t**  
Gatt service id, include id (uuid and instance id) and primary flag.

**Public Members**

*esp\_gatt\_id\_t* **id**  
Gatt id, include uuid and instance

bool **is\_primary**  
This service is primary or not

**struct esp\_attr\_desc\_t**  
Attribute description (used to create database)

**Public Members**

uint16\_t **uuid\_length**  
UUID length

uint8\_t \***uuid\_p**  
UUID value

uint16\_t **perm**  
Attribute permission

uint16\_t **max\_length**  
Maximum length of the element

uint16\_t **length**  
Current length of the element

uint8\_t \***value**  
Element value array

**struct esp\_attr\_control\_t**  
attribute auto response flag

**Public Members**

uint8\_t **auto\_rsp**  
if auto\_rsp set to ESP\_GATT\_RSP\_BY\_APP, means the response of Write/Read operation will be replied by application. if auto\_rsp set to ESP\_GATT\_AUTO\_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

**struct esp\_gatts\_attr\_db\_t**  
attribute type added to the gatt server database

**Public Members**

*esp\_attr\_control\_t* **attr\_control**  
The attribute control type

*esp\_attr\_desc\_t* **att\_desc**  
The attribute type

**struct esp\_attr\_value\_t**  
set the attribute value type

**Public Members**

uint16\_t **attr\_max\_len**  
attribute max value length

`uint16_t attr_len`  
attribute current value length

`uint8_t *attr_value`  
the pointer to attribute value

**struct esp\_gatts\_incl\_svc\_desc\_t**  
Gatt include service entry element.

### Public Members

`uint16_t start_hdl`  
Gatt start handle value of included service

`uint16_t end_hdl`  
Gatt end handle value of included service

`uint16_t uuid`  
Gatt attribute value UUID of included service

**struct esp\_gatts\_incl128\_svc\_desc\_t**  
Gatt include 128 bit service entry element.

### Public Members

`uint16_t start_hdl`  
Gatt start handle value of included 128 bit service

`uint16_t end_hdl`  
Gatt end handle value of included 128 bit service

**struct esp\_gatt\_value\_t**  
Gatt attribute value.

### Public Members

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`  
Gatt attribute value

`uint16_t handle`  
Gatt attribute handle

`uint16_t offset`  
Gatt attribute value offset

`uint16_t len`  
Gatt attribute value length

`uint8_t auth_req`  
Gatt authentication request

**struct esp\_gatt\_conn\_params\_t**  
Connection parameters information.

### Public Members

`uint16_t interval`  
connection interval

`uint16_t latency`  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_gattc\_multi\_t**

read multiple attribute

### Public Members

**uint8\_t num\_attr**

The number of the attribute

**uint16\_t handles[ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES]**

The handles list

**struct esp\_gattc\_db\_elem\_t**

data base attribute element

### Public Members

*esp\_gatt\_db\_attr\_type\_t* **type**

The attribute type

**uint16\_t attribute\_handle**

The attribute handle, it' s valid for all of the type

**uint16\_t start\_handle**

The service start handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

**uint16\_t end\_handle**

The service end handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties, it' s valid only when the type = ESP\_GATT\_DB\_CHARACTERISTIC

*esp\_bt\_uuid\_t* **uuid**

The attribute uuid, it' s valid for all of the type

**struct esp\_gattc\_service\_elem\_t**

service element

### Public Members

**bool is\_primary**

The service flag, true if the service is primary service, else is secondary service

**uint16\_t start\_handle**

The start handle of the service

**uint16\_t end\_handle**

The end handle of the service

*esp\_bt\_uuid\_t* **uuid**

The uuid of the service

**struct esp\_gattc\_char\_elem\_t**

characteristic element

**Public Members**

`uint16_t char_handle`  
The characteristic handle

`esp_gatt_char_prop_t properties`  
The characteristic properties

`esp_bt_uuid_t uuid`  
The characteristic uuid

`struct esp_gattc_descr_elem_t`  
descriptor element

**Public Members**

`uint16_t handle`  
The characteristic descriptor handle

`esp_bt_uuid_t uuid`  
The characteristic descriptor uuid

`struct esp_gattc_incl_svc_elem_t`  
include service element

**Public Members**

`uint16_t handle`  
The include service current attribute handle

`uint16_t incl_srvc_s_handle`  
The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`  
The end handle of the service which has been included

`esp_bt_uuid_t uuid`  
The include service uuid

**Macros**

`ESP_GATT_UUID_IMMEDIATE_ALERT_SVC`  
All “ESP\_GATT\_UUID\_XXX” is attribute types

`ESP_GATT_UUID_LINK_LOSS_SVC`

`ESP_GATT_UUID_TX_POWER_SVC`

`ESP_GATT_UUID_CURRENT_TIME_SVC`

`ESP_GATT_UUID_REF_TIME_UPDATE_SVC`

`ESP_GATT_UUID_NEXT_DST_CHANGE_SVC`

`ESP_GATT_UUID_GLUCOSE_SVC`

`ESP_GATT_UUID_HEALTH_THERMOM_SVC`

`ESP_GATT_UUID_DEVICE_INFO_SVC`

`ESP_GATT_UUID_HEART_RATE_SVC`

`ESP_GATT_UUID_PHONE_ALERT_STATUS_SVC`

**ESP\_GATT\_UUID\_CSC\_FEATURE**

**ESP\_GATT\_UUID\_SCAN\_INT\_WINDOW**

**ESP\_GATT\_UUID\_SCAN\_REFRESH**

**ESP\_GATT\_ILLEGAL\_UUID**

GATT INVALID UUID.

**ESP\_GATT\_ILLEGAL\_HANDLE**

GATT INVALID HANDLE.

**ESP\_GATT\_ATTR\_HANDLE\_MAX**

GATT attribute max handle.

**ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES**

**ESP\_GATT\_PERM\_READ**

Attribute permissions.

**ESP\_GATT\_PERM\_READ\_ENCRYPTED**

**ESP\_GATT\_PERM\_READ\_ENC\_MITM**

**ESP\_GATT\_PERM\_WRITE**

**ESP\_GATT\_PERM\_WRITE\_ENCRYPTED**

**ESP\_GATT\_PERM\_WRITE\_ENC\_MITM**

**ESP\_GATT\_PERM\_WRITE\_AUTHORIZATION**

**ESP\_GATT\_CHAR\_PROP\_BIT\_BROADCAST**

**ESP\_GATT\_CHAR\_PROP\_BIT\_READ**

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE\_NR**

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_NOTIFY**

**ESP\_GATT\_CHAR\_PROP\_BIT\_INDICATE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

**ESP\_GATT\_MAX\_ATTR\_LEN**

GATT maximum attribute length.

**ESP\_GATT\_RSP\_BY\_APP**

**ESP\_GATT\_AUTO\_RSP**

**ESP\_GATT\_IF\_NONE**

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

### Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different gatt\_if

### Enumerations

```
enum esp_gatt_prep_write_type
```

Attribute write data type from the client.

*Values:*

```
ESP_GATT_PREP_WRITE_CANCEL = 0x00
```

Prepare write cancel

```
ESP_GATT_PREP_WRITE_EXEC = 0x01
```

Prepare write execute

```
enum esp_gatt_status_t
```

GATT success code and error codes.

*Values:*

```
ESP_GATT_OK = 0x0
```

```
ESP_GATT_INVALID_HANDLE = 0x01
```

```
ESP_GATT_READ_NOT_PERMIT = 0x02
```

```
ESP_GATT_WRITE_NOT_PERMIT = 0x03
```

```
ESP_GATT_INVALID_PDU = 0x04
```

```
ESP_GATT_INSUF_AUTHENTICATION = 0x05
```

```
ESP_GATT_REQ_NOT_SUPPORTED = 0x06
```

```
ESP_GATT_INVALID_OFFSET = 0x07
```

```
ESP_GATT_INSUF_AUTHORIZATION = 0x08
```

```
ESP_GATT_PREPARE_Q_FULL = 0x09
```

```
ESP_GATT_NOT_FOUND = 0x0a
```

```
ESP_GATT_NOT_LONG = 0x0b
```

```
ESP_GATT_INSUF_KEY_SIZE = 0x0c
```

```
ESP_GATT_INVALID_ATTR_LEN = 0x0d
```

```
ESP_GATT_ERR_UNLIKELY = 0x0e
```

```
ESP_GATT_INSUF_ENCRYPTION = 0x0f
```

```
ESP_GATT_UNSUPPORT_GRP_TYPE = 0x10
```

```
ESP_GATT_INSUF_RESOURCE = 0x11
```

```
ESP_GATT_NO_RESOURCES = 0x80
```

```
ESP_GATT_INTERNAL_ERROR = 0x81
```

```
ESP_GATT_WRONG_STATE = 0x82
```

```
ESP_GATT_DB_FULL = 0x83
```

```
ESP_GATT_BUSY = 0x84
```

```
ESP_GATT_ERROR = 0x85
```

```
ESP_GATT_CMD_STARTED = 0x86
```

**ESP\_GATT\_ILLEGAL\_PARAMETER** = 0x87  
**ESP\_GATT\_PENDING** = 0x88  
**ESP\_GATT\_AUTH\_FAIL** = 0x89  
**ESP\_GATT\_MORE** = 0x8a  
**ESP\_GATT\_INVALID\_CFG** = 0x8b  
**ESP\_GATT\_SERVICE\_STARTED** = 0x8c  
**ESP\_GATT\_ENCRYPED\_MITM** = *ESP\_GATT\_OK*  
**ESP\_GATT\_ENCRYPED\_NO\_MITM** = 0x8d  
**ESP\_GATT\_NOT\_ENCRYPTED** = 0x8e  
**ESP\_GATT\_CONGESTED** = 0x8f  
**ESP\_GATT\_DUP\_REG** = 0x90  
**ESP\_GATT\_ALREADY\_OPEN** = 0x91  
**ESP\_GATT\_CANCEL** = 0x92  
**ESP\_GATT\_STACK\_RSP** = 0xe0  
**ESP\_GATT\_APP\_RSP** = 0xe1  
**ESP\_GATT\_UNKNOWN\_ERROR** = 0xef  
**ESP\_GATT\_CCC\_CFG\_ERR** = 0xfd  
**ESP\_GATT\_PRC\_IN\_PROGRESS** = 0xfe  
**ESP\_GATT\_OUT\_OF\_RANGE** = 0xff

**enum esp\_gatt\_conn\_reason\_t**

Gatt Connection reason enum.

*Values:*

**ESP\_GATT\_CONN\_UNKNOWN** = 0  
Gatt connection unknown

**ESP\_GATT\_CONN\_L2C\_FAILURE** = 1  
General L2cap failure

**ESP\_GATT\_CONN\_TIMEOUT** = 0x08  
Connection timeout

**ESP\_GATT\_CONN\_TERMINATE\_PEER\_USER** = 0x13  
Connection terminate by peer user

**ESP\_GATT\_CONN\_TERMINATE\_LOCAL\_HOST** = 0x16  
Connection terminated by local host

**ESP\_GATT\_CONN\_FAIL\_ESTABLISH** = 0x3e  
Connection fail to establish

**ESP\_GATT\_CONN\_LMP\_TIMEOUT** = 0x22  
Connection fail for LMP response tout

**ESP\_GATT\_CONN\_CONN\_CANCEL** = 0x0100  
L2CAP connection cancelled

**ESP\_GATT\_CONN\_NONE** = 0x0101  
No connection to cancel

**enum esp\_gatt\_auth\_req\_t**

Gatt authentication request type.

*Values:*

```
ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4
```

```
enum esp_service_source_t
```

*Values:*

```
ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2
```

```
enum esp_gatt_write_type_t
```

Gatt write type.

*Values:*

```
ESP_GATT_WRITE_TYPE_NO_RSP = 1
    Gatt write attribute need no response
ESP_GATT_WRITE_TYPE_RSP
    Gatt write attribute need remote response
```

```
enum esp_gatt_db_attr_type_t
```

the type of attribute element

*Values:*

```
ESP_GATT_DB_PRIMARY_SERVICE
    Gattc primary service attribute type in the cache
ESP_GATT_DB_SECONDARY_SERVICE
    Gattc secondary service attribute type in the cache
ESP_GATT_DB_CHARACTERISTIC
    Gattc characteristic attribute type in the cache
ESP_GATT_DB_DESCRIPTOR
    Gattc characteristic descriptor attribute type in the cache
ESP_GATT_DB_INCLUDED_SERVICE
    Gattc include service attribute type in the cache
ESP_GATT_DB_ALL
    Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type
    in the cache
```

## GATT SERVER API

### Overview [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.

- [bluetooth/bluedroid/ble/gatt\\_server](#)
- [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

### Header File

### Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

#### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

#### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srvc\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] service\_id: service ID.
- [in] num\_handle: number of handle requested for this service.

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint8\_t max\_nb\_attr, uint8\_t srvc\_inst\_id)

Create a service attribute tab.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_attr\_db: the pointer to the service attr tab
- [in] gatts\_if: GATT server access interface
- [in] max\_nb\_attr: the number of attribute to be added to the service database.

- [in] `srvc_inst_id`: the instance id of the service

`esp_err_t esp_ble_gatts_add_included_service` (uint16\_t *service\_handle*, uint16\_t *included\_service\_handle*)

This function is called to add an included service. This function have to be called between 'esp\_ble\_gatts\_create\_service' and 'esp\_ble\_gatts\_add\_char'. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `included_service_handle`: the service ID to be included.

`esp_err_t esp_ble_gatts_add_char` (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**char\_uuid*, *esp\_gatt\_perm\_t* *perm*, *esp\_gatt\_char\_prop\_t* *property*, *esp\_attr\_value\_t* \**char\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add a characteristic into a service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `char_uuid`: : Characteristic UUID.
- [in] `perm`: : Characteristic value declaration attribute permission.
- [in] `property`: : Characteristic Properties
- [in] `char_val`: : Characteristic value
- [in] `control`: : attribute response control byte

`esp_err_t esp_ble_gatts_add_char_descr` (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**descr\_uuid*, *esp\_gatt\_perm\_t* *perm*, *esp\_attr\_value\_t* \**char\_descr\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add characteristic descriptor. When it's done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this characteristic descriptor is to be added.
- [in] `perm`: descriptor access permission.
- [in] `descr_uuid`: descriptor UUID.
- [in] `char_descr_val`: : Characteristic descriptor value
- [in] `control`: : attribute response control byte

`esp_err_t esp_ble_gatts_delete_service` (uint16\_t *service\_handle*)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: `service_handle` to be deleted.

`esp_err_t esp_ble_gatts_start_service` (uint16\_t *service\_handle*)

This function is called to start a service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: the service handle to be started.

`esp_err_t esp_ble_gatts_stop_service` (uint16\_t *service\_handle*)

This function is called to stop a service.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `service_handle`: - service to be topped.

`esp_err_t esp_ble_gatts_send_indicate` (*esp\_gatt\_if\_t gatts\_if*, uint16\_t *conn\_id*, uint16\_t *attr\_handle*, uint16\_t *value\_len*, uint8\_t *\*value*, bool *need\_confirm*)

Send indicate or notify to GATT client. Set param `need_confirm` as false will send notification, otherwise indication.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection id to indicate.
- [in] `attr_handle`: - attribute handle to indicate.
- [in] `value_len`: - indicate value length.
- [in] `value`: value to indicate.
- [in] `need_confirm`: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

`esp_err_t esp_ble_gatts_send_response` (*esp\_gatt\_if\_t gatts\_if*, uint16\_t *conn\_id*, uint32\_t *trans\_id*, *esp\_gatt\_status\_t status*, *esp\_gatt\_rsp\_t \*rsp*)

This function is called to send a response to a request.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection identifier.
- [in] `trans_id`: - transfer id
- [in] `status`: - response status
- [in] `rsp`: - response data.

`esp_err_t esp_ble_gatts_set_attr_value` (uint16\_t *attr\_handle*, uint16\_t *length*, const uint8\_t *\*value*)

This function is called to set the attribute value by the application.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `attr_handle`: the attribute handle which to be set
- [in] `length`: the value length
- [in] `value`: the pointer to the attribute value

`esp_gatt_status_t esp_ble_gatts_get_attr_value` (uint16\_t *attr\_handle*, uint16\_t *\*length*, const uint8\_t *\*\*value*)

Retrieve attribute value.

**Return**

- `ESP_GATT_OK` : success
- other : failed

**Parameters**

- [in] `attr_handle`: Attribute handle.

- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Open a direct open connection or add a background auto connection.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] remote\_bda: remote device bluetooth device address.
- [in] is\_direct: direct connection or background auto connection

*esp\_err\_t* **esp\_ble\_gatts\_close** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id)

Close a connection a remote device.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: connection ID to be closed.

*esp\_err\_t* **esp\_ble\_gatts\_send\_service\_change\_indication** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda)

Send service change indication.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] remote\_bda: remote device bluetooth device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

## Unions

**union esp\_ble\_gatts\_cb\_param\_t**

#include <esp\_gatts\_api.h> Gatt server callback parameters union.

### Public Members

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_reg\_evt\_param reg**

Gatt server callback param of ESP\_GATTS\_REG\_EVT

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_read\_evt\_param read**

Gatt server callback param of ESP\_GATTS\_READ\_EVT

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_write\_evt\_param write**

Gatt server callback param of ESP\_GATTS\_WRITE\_EVT

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_exec\_write\_evt\_param exec\_write**

Gatt server callback param of ESP\_GATTS\_EXEC\_WRITE\_EVT

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_mtu\_evt\_param mtu**

Gatt server callback param of ESP\_GATTS\_MTU\_EVT

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_conf\_evt\_param conf**

Gatt server callback param of ESP\_GATTS\_CONF\_EVT (confirm)

**struct esp\_ble\_gatts\_cb\_param\_t::gatts\_create\_evt\_param create**

Gatt server callback param of ESP\_GATTS\_CREATE\_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc  
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

Service attribute handle

**struct gatts\_stop\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_STOP\_EVT.

**Public Members**

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

**struct gatts\_write\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_WRITE\_EVT.

### Public Members

`uint16_t conn_id`  
Connection id

`uint32_t trans_id`  
Transfer id

`esp_bd_addr_t bda`  
The bluetooth device address which been written

`uint16_t handle`  
The attribute handle

`uint16_t offset`  
Offset of the value, if the value is too long

`bool need_rsp`  
The write operation need to do response

`bool is_prep`  
This write operation is prepare write

`uint16_t len`  
The write attribute value length

`uint8_t *value`  
The write attribute value

### Macros

`ESP_GATT_PREP_WRITE_CANCEL`  
Prepare write flag to indicate cancel prepare write

`ESP_GATT_PREP_WRITE_EXEC`  
Prepare write flag to indicate execute prepare write

### Type Definitions

```
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
                             esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

#### Parameters

- `event`: : Event type
- `gatts_if`: : GATT server access interface, normally different `gatts_if` correspond to different profile
- `param`: : Point to callback parameter, currently is union type

### Enumerations

```
enum esp_gatts_cb_event_t
```

GATT Server callback function events.

*Values:*

`ESP_GATTS_REG_EVT = 0`  
When register application id, the event comes

`ESP_GATTS_READ_EVT = 1`  
When gatt client request read operation, the event comes

`ESP_GATTS_WRITE_EVT = 2`  
When gatt client request write operation, the event comes

`ESP_GATTS_EXEC_WRITE_EVT = 3`  
When gatt client request execute write, the event comes

- ESP\_GATTS\_MTU\_EVT = 4**  
When set mtu complete, the event comes
- ESP\_GATTS\_CONF\_EVT = 5**  
When receive confirm, the event comes
- ESP\_GATTS\_UNREG\_EVT = 6**  
When unregister application id, the event comes
- ESP\_GATTS\_CREATE\_EVT = 7**  
When create service complete, the event comes
- ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT = 8**  
When add included service complete, the event comes
- ESP\_GATTS\_ADD\_CHAR\_EVT = 9**  
When add characteristic complete, the event comes
- ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT = 10**  
When add descriptor complete, the event comes
- ESP\_GATTS\_DELETE\_EVT = 11**  
When delete service complete, the event comes
- ESP\_GATTS\_START\_EVT = 12**  
When start service complete, the event comes
- ESP\_GATTS\_STOP\_EVT = 13**  
When stop service complete, the event comes
- ESP\_GATTS\_CONNECT\_EVT = 14**  
When gatt client connect, the event comes
- ESP\_GATTS\_DISCONNECT\_EVT = 15**  
When gatt client disconnect, the event comes
- ESP\_GATTS\_OPEN\_EVT = 16**  
When connect to peer, the event comes
- ESP\_GATTS\_CANCEL\_OPEN\_EVT = 17**  
When disconnect from peer, the event comes
- ESP\_GATTS\_CLOSE\_EVT = 18**  
When gatt server close, the event comes
- ESP\_GATTS\_LISTEN\_EVT = 19**  
When gatt listen to be connected the event comes
- ESP\_GATTS\_CONGEST\_EVT = 20**  
When congest happen, the event comes
- ESP\_GATTS\_RESPONSE\_EVT = 21**  
When gatt send response complete, the event comes
- ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT = 22**  
When gatt create table complete, the event comes
- ESP\_GATTS\_SET\_ATTR\_VAL\_EVT = 23**  
When gatt set attr value complete, the event comes
- ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT = 24**  
When gatt send service change indication complete, the event comes

## GATT CLIENT API

[Overview](#) [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - [bluetooth/bluedroid/ble/gatt\\_client](#)
  - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - [bluetooth/bluedroid/ble/gattc\\_multi\\_connect](#)
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_client](#)

## API Reference

### Functions

*esp\_err\_t* **esp\_ble\_gattc\_register\_callback** (*esp\_gattc\_cb\_t* callback)

This function is called to register application callbacks with GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] callback: : pointer to the application callback function.

*esp\_err\_t* **esp\_ble\_gattc\_app\_register** (uint16\_t app\_id)

This function is called to register application callbacks with GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] app\_id: : Application Identify (UUID), for different application

*esp\_err\_t* **esp\_ble\_gattc\_app\_unregister** (*esp\_gatt\_if\_t* gattc\_if)

This function is called to unregister an application from GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.

*esp\_err\_t* **esp\_ble\_gattc\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

Open a direct connection or add a background auto connection.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] remote\_bda: remote device bluetooth device address.
- [in] remote\_addr\_type: remote device bluetooth device the address type.

- [in] `is_direct`: direct connection or background auto connection (by now, background auto connection is not supported).

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`)

Close the virtual connection to the GATT server. `gattc` may have multiple virtual GATT server connections when multiple `app_id` registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use `esp_ble_gap_disconnect(esp_bd_addr_t remote_device)`.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID to be closed.

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use `esp_ble_gatt_set_local_mtu()` to configure the local MTU size.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *esp\_bt\_uuid\_t* `*filter_uuid`)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `filter_uuid`: a UUID of the service application is interested in. If Null, discover for all services.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_service** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *esp\_bt\_uuid\_t* `*svc_uuid`, *esp\_gattc\_service\_elem\_t* `*result`, *uint16\_t* `*count`, *uint16\_t* `offset`)

Find all the service with the given service uuid in the `gattc` cache, if the `svc_uuid` is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the `esp_ble_gattc_cache_refresh`, then call `esp_ble_gattc_get_service` again.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `svc_uuid`: the pointer to the service uuid.
- [out] `result`: The pointer to the service which has been found in the `gattc` cache.
- [inout] `count`: input the number of service want to find, it will output the number of service has been found in the `gattc` cache with the given service uuid.
- [in] `offset`: Offset of the service position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t end_handle,
esp_gattc_char_elem_t *result, uint16_t *count,
uint16_t offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle.
- [in] end\_handle: the attribute end handle
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] offset: Offset of the characteristic position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
char_handle, esp_gattc_descr_elem_t *result,
uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] char\_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t
end_handle, esp_bt_uuid_t char_uuid,
esp_gattc_char_elem_t *result, uint16_t
*count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] char\_uuid: the characteristic uuid
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] char\_uuid: the characteristic uuid.
- [in] descr\_uuid: the descriptor uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] char\_handle: the characteristic handle.
- [in] descr\_uuid: the descriptor uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] incl\_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.

- [inout] `count`: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                             esp_gatt_db_attr_type_t type, uint16_t
                                             start_handle, uint16_t end_handle, uint16_t
                                             char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `type`: the attribute type.
- [in] `start_handle`: the attribute start handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- [in] `end_handle`: the attribute end handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- [in] `char_handle`: the characteristic handle, this parameter valid when the type is ESP\_GATT\_DB\_DESCRIPTOR. If the type isn't ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore.
- [out] `count`: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                       start_handle, uint16_t end_handle, esp_gattc_db_elem_t
                                       *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                  esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to read.
- [in] `auth_req`: authenticate request type

```
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                       start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid,
                                       esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic UUID.

#### Return

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *start\_handle*: : the attribute start handle.
- [in] *end\_handle*: : the attribute end handle
- [in] *uuid*: : The UUID of attribute which will be read.
- [in] *auth\_req*: : authenticate request type

```
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id,  
                                     esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t  
                                     auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *read\_multi*: : pointer to the read multiple parameter.
- [in] *auth\_req*: : authenticate request type

```
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t han-  
                                         dle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *handle*: : descriptor handle to read.
- [in] *auth\_req*: : authenticate request type

```
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,  
                                   uint16_t value_len, uint8_t *value, esp_gatt_write_type_t  
                                   write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *handle*: : characteristic handle to write.
- [in] *value\_len*: length of the value to be written.
- [in] *value*: : the value to be written.
- [in] *write\_type*: : the type of attribute write operation.
- [in] *auth\_req*: : authentication request.

```
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,  
                                          uint16_t handle, uint16_t value_len, uint8_t  
                                          *value, esp_gatt_write_type_t write_type,  
                                          esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID
- [in] `handle`: : descriptor handle to write.
- [in] `value_len`: length of the value to be written.
- [in] `value`: : the value to be written.
- [in] `write_type`: : the type of attribute write operation.
- [in] `auth_req`: : authentication request.

`esp_err_t esp_ble_gattc_prepare_write` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `uint16_t handle`, `uint16_t offset`, `uint16_t value_len`, `uint8_t *value`, `esp_gatt_auth_req_t auth_req`)

This function is called to prepare write a characteristic value.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID.
- [in] `handle`: : characteristic handle to prepare write.
- [in] `offset`: : offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: : the value to be written.
- [in] `auth_req`: : authentication request.

`esp_err_t esp_ble_gattc_prepare_write_char_descr` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `uint16_t handle`, `uint16_t offset`, `uint16_t value_len`, `uint8_t *value`, `esp_gatt_auth_req_t auth_req`)

This function is called to prepare write a characteristic descriptor value.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID.
- [in] `handle`: : characteristic descriptor handle to prepare write.
- [in] `offset`: : offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: : the value to be written.
- [in] `auth_req`: : authentication request.

`esp_err_t esp_ble_gattc_execute_write` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `bool is_execute`)

This function is called to execute write a prepare write sequence.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID.
- [in] `is_execute`: : execute or cancel.

`esp_err_t esp_ble_gattc_register_for_notify` (`esp_gatt_if_t gattc_if`, `esp_bd_addr_t server_bda`, `uint16_t handle`)

This function is called to register for notification of a service.

**Return**

- `ESP_OK`: registration succeeds
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* `gattc_if`, *esp\_bd\_addr\_t* `server_bda`, `uint16_t handle`)

This function is called to de-register for notification of a service.

**Return**

- `ESP_OK`: unregister succeeds
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* `remote_bda`)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `remote_bda`: remote device BD address.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* `gattc_if`, *esp\_bd\_addr\_t* `src_addr`, *esp\_bd\_addr\_t* `assoc_addr`, `bool is_assoc`)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `src_addr`: the source address which provide the attribute table.
- [in] `assoc_addr`: the associated device address which went to share the attribute table with the source address.
- [in] `is_assoc`: true add the associated device address, false remove the associated device address.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* `gattc_if`)

Get the address list which has store the attribute table in the gattc cache. There will callback `ESP_GATTC_GET_ADDR_LIST_EVT` event when get address list complete.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* `remote_bda`)

Clean the service cache of this device in the gattc stack,.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- [in] remote\_bda: remote device BD address.

The prepare write offset, this value is valid only when prepare write

### Type Definitions

```
typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
esp_ble_gattc_cb_param_t *param)
GATT Client callback function type.
```

#### Parameters

- event: : Event type
- gattc\_if: : GATT client access interface, normally different gattc\_if correspond to different profile
- param: : Point to callback parameter, currently is union type

### Enumerations

```
enum esp_gattc_cb_event_t
GATT Client callback function events.
```

Values:

- ESP\_GATTC\_REG\_EVT = 0**  
When GATT client is registered, the event comes
- ESP\_GATTC\_UNREG\_EVT = 1**  
When GATT client is unregistered, the event comes
- ESP\_GATTC\_OPEN\_EVT = 2**  
When GATT virtual connection is set up, the event comes
- ESP\_GATTC\_READ\_CHAR\_EVT = 3**  
When GATT characteristic is read, the event comes
- ESP\_GATTC\_WRITE\_CHAR\_EVT = 4**  
When GATT characteristic write operation completes, the event comes
- ESP\_GATTC\_CLOSE\_EVT = 5**  
When GATT virtual connection is closed, the event comes
- ESP\_GATTC\_SEARCH\_CMPL\_EVT = 6**  
When GATT service discovery is completed, the event comes
- ESP\_GATTC\_SEARCH\_RES\_EVT = 7**  
When GATT service discovery result is got, the event comes
- ESP\_GATTC\_READ\_DESCR\_EVT = 8**  
When GATT characteristic descriptor read completes, the event comes
- ESP\_GATTC\_WRITE\_DESCR\_EVT = 9**  
When GATT characteristic descriptor write completes, the event comes
- ESP\_GATTC\_NOTIFY\_EVT = 10**  
When GATT notification or indication arrives, the event comes
- ESP\_GATTC\_PREP\_WRITE\_EVT = 11**  
When GATT prepare-write operation completes, the event comes
- ESP\_GATTC\_EXEC\_EVT = 12**  
When write execution completes, the event comes
- ESP\_GATTC\_ACL\_EVT = 13**  
When ACL connection is up, the event comes
- ESP\_GATTC\_CANCEL\_OPEN\_EVT = 14**  
When GATT client ongoing connection is cancelled, the event comes
- ESP\_GATTC\_SRVC\_CHG\_EVT = 15**  
When “service changed” occurs, the event comes
- ESP\_GATTC\_ENC\_CMPL\_CB\_EVT = 17**  
When encryption procedure completes, the event comes
- ESP\_GATTC\_CFG\_MTU\_EVT = 18**  
When configuration of MTU completes, the event comes
- ESP\_GATTC\_ADV\_DATA\_EVT = 19**  
When advertising of data, the event comes
- ESP\_GATTC\_MULT\_ADV\_ENB\_EVT = 20**  
When multi-advertising is enabled, the event comes
- ESP\_GATTC\_MULT\_ADV\_UPD\_EVT = 21**  
When multi-advertising parameters are updated, the event comes
- ESP\_GATTC\_MULT\_ADV\_DATA\_EVT = 22**  
When multi-advertising data arrives, the event comes
- ESP\_GATTC\_MULT\_ADV\_DIS\_EVT = 23**  
When multi-advertising is disabled, the event comes

**ESP\_GATTC\_CONGEST\_EVT = 24**

When GATT connection congestion comes, the event comes

**ESP\_GATTC\_BTH\_SCAN\_ENB\_EVT = 25**

When batch scan is enabled, the event comes

**ESP\_GATTC\_BTH\_SCAN\_CFG\_EVT = 26**

When batch scan storage is configured, the event comes

**ESP\_GATTC\_BTH\_SCAN\_RD\_EVT = 27**

When Batch scan read event is reported, the event comes

**ESP\_GATTC\_BTH\_SCAN\_THR\_EVT = 28**

When Batch scan threshold is set, the event comes

**ESP\_GATTC\_BTH\_SCAN\_PARAM\_EVT = 29**

When Batch scan parameters are set, the event comes

**ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT = 30**

When Batch scan is disabled, the event comes

**ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT = 31**

When Scan filter configuration completes, the event comes

**ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT = 32**

When Scan filter parameters are set, the event comes

**ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT = 33**

When Scan filter status is reported, the event comes

**ESP\_GATTC\_ADV\_VSC\_EVT = 34**

When advertising vendor spec content event is reported, the event comes

**ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT = 38**

When register for notification of a service completes, the event comes

**ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT = 39**

When unregister for notification of a service completes, the event comes

**ESP\_GATTC\_CONNECT\_EVT = 40**

When the ble physical connection is set up, the event comes

**ESP\_GATTC\_DISCONNECT\_EVT = 41**

When the ble physical connection disconnected, the event comes

**ESP\_GATTC\_READ\_MULTIPLE\_EVT = 42**

When the ble characteristic or descriptor multiple complete, the event comes

**ESP\_GATTC\_QUEUE\_FULL\_EVT = 43**

When the gattc command queue full, the event comes

**ESP\_GATTC\_SET\_ASSOC\_EVT = 44**

When the ble gattc set the associated address complete, the event comes

**ESP\_GATTC\_GET\_ADDR\_LIST\_EVT = 45**

When the ble get gattc address list in cache finish, the event comes

**ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT = 46**

When the ble discover service complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.

2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example** Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - `bluetooth/bluedroid/ble/blufi`

## API Reference

### Header File

- `bt/host/bluedroid/api/include/api/esp_blufi_api.h`

### Functions

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`

This function is called to receive blufi callback event.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `[in] callbacks`: callback functions

`esp_err_t esp_blufi_profile_init (void)`

This function is called to initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`

This function is called to de-initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`

This function is called to send wifi connection report.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `opmode`: : wifi opmode
- `sta_conn_state`: : station is already in connection or not
- `softap_conn_num`: : softap connection number
- `extra_info`: : extra information, such as `sta_ssid`, `softap_ssid` and etc.

`esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)`

This function is called to send wifi list.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `apCount`: : wifi list count
- `list`: : wifi list

`uint16_t esp_blufi_get_version (void)`

Get BLUFI profile version.

**Return** Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_close (esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

#### Return

- ESP\_OK : success

- other : failed

**Parameters**

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: connection ID to be closed.

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* state)

This function is called to send blufi error information.

**Return** ESP\_OK - success, other - failed

**Parameters**

- state: : error state

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (uint8\_t \*data, uint32\_t data\_len)

This function is called to custom data.

**Return** ESP\_OK - success, other - failed

**Parameters**

- data: : custom data value
- data\_len: : the length of custom data

**Unions**

**union esp\_blufi\_cb\_param\_t**

#include <esp\_blufi\_api.h> BLUFI callback parameters union.

**Public Members**

**struct esp\_blufi\_cb\_param\_t::blufi\_init\_finish\_evt\_param** **init\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_deinit\_finish\_evt\_param** **deinit\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DEINIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_set\_wifi\_mode\_evt\_param** **wifi\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_connect\_evt\_param** **connect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_CONNECT

**struct esp\_blufi\_cb\_param\_t::blufi\_disconnect\_evt\_param** **disconnect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DISCONNECT

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_bssid\_evt\_param** **sta\_bssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_BSSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_ssid\_evt\_param** **sta\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_SSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_passwd\_evt\_param** **sta\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_PASSWD

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_ssid\_evt\_param** **softap\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_SSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_passwd\_evt\_param** **softap\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_PASSWD

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_max\_conn\_num\_evt\_param** **softap\_max\_conn\_num**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_MAX\_CONN\_NUM

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_auth\_mode\_evt\_param** **softap\_auth\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_AUTH\_MODE

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_channel\_evt\_param** **softap\_channel**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_CHANNEL

```

struct esp_blufi_cb_param_t::blufi_rcv_username_evt_param username
    Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_cb_param_t::blufi_rcv_ca_evt_param ca
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

struct esp_blufi_cb_param_t::blufi_rcv_client_cert_evt_param client_cert
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

struct esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param server_cert
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

struct esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param client_pkey
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param server_pkey
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error
    Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

struct esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param custom_data
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

SSID of AP

`int8_t rssi`  
signal strength of AP

**struct esp\_blufi\_callbacks\_t**  
BLUFI callback functions type.

**Public Members**

*esp\_blufi\_event\_cb\_t* **event\_cb**  
BLUFI event callback

*esp\_blufi\_negotiate\_data\_handler\_t* **negotiate\_data\_handler**  
BLUFI negotiate data function for negotiate share key

*esp\_blufi\_encrypt\_func\_t* **encrypt\_func**  
BLUFI encrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_decrypt\_func\_t* **decrypt\_func**  
BLUFI decrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_checksum\_func\_t* **checksum\_func**  
BLUFI check sum function (FCS)

**Type Definitions**

**typedef void (\*esp\_blufi\_event\_cb\_t)** (*esp\_blufi\_cb\_event\_t* event, *esp\_blufi\_cb\_param\_t* \*param)

BLUFI event callback function type.

**Parameters**

- event: : Event type
- param: : Point to callback parameter, currently is union type

**typedef void (\*esp\_blufi\_negotiate\_data\_handler\_t)** (`uint8_t *data`, `int len`, `uint8_t **output_data`, `int *output_len`, `bool *need_free`)

BLUFI negotiate data handler.

**Parameters**

- data: : data from phone
- len: : length of data from phone
- output\_data: : data want to send to phone
- output\_len: : length of data want to send to phone
- need\_free: : output reporting if memory needs to be freed or not \*

**typedef int (\*esp\_blufi\_encrypt\_func\_t)** (`uint8_t iv8`, `uint8_t *crypt_data`, `int crypt_len`)  
BLUFI encrypt the data after negotiate a share key.

**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**

- iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
- crypt\_data: : plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt\_len: : length of plain text

**typedef int (\*esp\_blufi\_decrypt\_func\_t)** (`uint8_t iv8`, `uint8_t *crypt_data`, `int crypt_len`)  
BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: : encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: : length of encrypted text

```
typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)  
BLUFI checksum.
```

#### Parameters

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `data`: : data need to checksum
- `len`: : length of data

#### Enumerations

```
enum esp_blufi_cb_event_t
```

*Values:*

```
ESP_BLUFI_EVENT_INIT_FINISH = 0  
ESP_BLUFI_EVENT_DEINIT_FINISH  
ESP_BLUFI_EVENT_SET_WIFI_OPMODE  
ESP_BLUFI_EVENT_BLE_CONNECT  
ESP_BLUFI_EVENT_BLE_DISCONNECT  
ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP  
ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP  
ESP_BLUFI_EVENT_GET_WIFI_STATUS  
ESP_BLUFI_EVENT_DEAUTHENTICATE_STA  
ESP_BLUFI_EVENT_RECV_STA_BSSID  
ESP_BLUFI_EVENT_RECV_STA_SSID  
ESP_BLUFI_EVENT_RECV_STA_PASSWD  
ESP_BLUFI_EVENT_RECV_SOFTAP_SSID  
ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD  
ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM  
ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE  
ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL  
ESP_BLUFI_EVENT_RECV_USERNAME  
ESP_BLUFI_EVENT_RECV_CA_CERT  
ESP_BLUFI_EVENT_RECV_CLIENT_CERT  
ESP_BLUFI_EVENT_RECV_SERVER_CERT  
ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY  
ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY  
ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE  
ESP_BLUFI_EVENT_GET_WIFI_LIST  
ESP_BLUFI_EVENT_REPORT_ERROR  
ESP_BLUFI_EVENT_RECV_CUSTOM_DATA
```

**enum esp\_blufi\_sta\_conn\_state\_t**

BLUFI config status.

*Values:*

**ESP\_BLUFI\_STA\_CONN\_SUCCESS** = 0x00

**ESP\_BLUFI\_STA\_CONN\_FAIL** = 0x01

**enum esp\_blufi\_init\_state\_t**

BLUFI init status.

*Values:*

**ESP\_BLUFI\_INIT\_OK** = 0

**ESP\_BLUFI\_INIT\_FAILED**

**enum esp\_blufi\_deinit\_state\_t**

BLUFI deinit status.

*Values:*

**ESP\_BLUFI\_DEINIT\_OK** = 0

**ESP\_BLUFI\_DEINIT\_FAILED**

**enum esp\_blufi\_error\_state\_t**

*Values:*

**ESP\_BLUFI\_SEQUENCE\_ERROR** = 0

**ESP\_BLUFI\_CHECKSUM\_ERROR**

**ESP\_BLUFI\_DECRYPT\_ERROR**

**ESP\_BLUFI\_ENCRYPT\_ERROR**

**ESP\_BLUFI\_INIT\_SECURITY\_ERROR**

**ESP\_BLUFI\_DH\_MALLOC\_ERROR**

**ESP\_BLUFI\_DH\_PARAM\_ERROR**

**ESP\_BLUFI\_READ\_PARAM\_ERROR**

**ESP\_BLUFI\_DATA\_FORMAT\_ERROR**

## 2.1.4 CLASSIC BT

### CLASSIC BLUETOOTH GAP API

**Overview** [Instructions](#)

**Application Example** [Instructions](#)

#### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gap\\_bt\\_api.h](#)

## Functions

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_srvc** (uint32\_t *cod*)  
get major service field of COD

**Return** major service bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_major\_dev** (uint32\_t *cod*)  
get major device field of COD

**Return** major device bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_minor\_dev** (uint32\_t *cod*)  
get minor service field of COD

**Return** minor service bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_format\_type** (uint32\_t *cod*)  
get format type of COD

**Return** format type

**Parameters**

- [in] *cod*: Class of Device

**static** bool **esp\_bt\_gap\_is\_valid\_cod** (uint32\_t *cod*)  
decide the integrity of COD

**Return**

- true if *cod* is valid
- false otherwise

**Parameters**

- [in] *cod*: Class of Device

*esp\_err\_t* **esp\_bt\_gap\_register\_callback** (*esp\_bt\_gap\_cb\_t* *callback*)  
register callback function. This function should be called after `esp_bluedroid_enable()` completes successfully

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

*esp\_err\_t* **esp\_bt\_gap\_set\_scan\_mode** (*esp\_bt\_connection\_mode\_t* *c\_mode*,  
*esp\_bt\_discovery\_mode\_t* *d\_mode*)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG: if argument invalid
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *c\_mode*: : one of the enums of `esp_bt_connection_mode_t`
- [in] *d\_mode*: : one of the enums of `esp_bt_discovery_mode_t`

*esp\_err\_t* **esp\_bt\_gap\_start\_discovery** (*esp\_bt\_inq\_mode\_t* *mode*, uint8\_t *inq\_len*, uint8\_t  
*num\_rsps*)

This function starts Inquiry and Name Discovery. It should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_DISC\_RES\_EVT each time the two types of discovery results are got.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_INVALID\_ARG: if invalid parameters are provided
- ESP\_FAIL: others

**Parameters**

- [in] mode: - Inquiry mode
- [in] inq\_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
  - when this time expires, Inquiry will be halted.
- [in] num\_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

**esp\_err\_t esp\_bt\_gap\_cancel\_discovery** (void)

Cancel Inquiry and Name Discovery. This function should be called after esp\_bluedroid\_enable() completes successfully. esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_DISC\_STATE\_CHANGED\_EVT if Inquiry or Name Discovery is cancelled by calling this function.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**esp\_err\_t esp\_bt\_gap\_get\_remote\_services** (esp\_bd\_addr\_t remote\_bda)

Start SDP to get remote services. This function should be called after esp\_bluedroid\_enable() completes successfully. esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_RMT\_SRVCS\_EVT after service discovery ends.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**esp\_err\_t esp\_bt\_gap\_get\_remote\_service\_record** (esp\_bd\_addr\_t remote\_bda, esp\_bt\_uuid\_t \*uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp\_bluedroid\_enable() completes successfully.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_RMT\_SRVC\_REC\_EVT after service discovery ends

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**uint8\_t \*esp\_bt\_gap\_resolve\_eir\_data** (uint8\_t \*eir, esp\_bt\_eir\_type\_t type, uint8\_t \*length)

This function is called to get EIR data for a specific type.

**Return** pointer of starting position of eir data excluding eir data type, NULL if not found

**Parameters**

- [in] eir: - pointer of raw eir data to be resolved
- [in] type: - specific EIR data type
- [out] length: - return the length of EIR data excluding fields of length and data type

**esp\_err\_t esp\_bt\_gap\_config\_eir\_data** (esp\_bt\_eir\_data\_t \*eir\_data)

This function is called to config EIR data.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_CONFIG\_EIR\_DATA\_EVT after config EIR ends.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled

- ESP\_ERR\_INVALID\_ARG: if param is invalid
- ESP\_FAIL: others

**Parameters**

- [in] eir\_data: - pointer of EIR data content

*esp\_err\_t* **esp\_bt\_gap\_set\_cod** (*esp\_bt\_cod\_t* cod, *esp\_bt\_cod\_mode\_t* mode)

This function is called to set class of device. `esp_bt_gap_cb_t` will be called with ESP\_BT\_GAP\_SET\_COD\_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_INVALID\_ARG: if param is invalid
- ESP\_FAIL: others

**Parameters**

- [in] cod: - class of device
- [in] mode: - setting mode

*esp\_err\_t* **esp\_bt\_gap\_get\_cod** (*esp\_bt\_cod\_t* \*cod)

This function is called to get class of device.

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

**Parameters**

- [out] cod: - class of device

*esp\_err\_t* **esp\_bt\_gap\_read\_rssi\_delta** (*esp\_bd\_addr\_t* remote\_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP\_BT\_GAP\_READ\_RSSI\_DELTA\_EVT.

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: - remote device address, corresponding to a certain connection handle.

*esp\_err\_t* **esp\_bt\_gap\_remove\_bond\_device** (*esp\_bd\_addr\_t* bd\_addr)

Removes a device from the security database list of peer device.

**Return** - ESP\_OK : success

- ESP\_FAIL : failed

**Parameters**

- [in] bd\_addr: : BD address of the peer device

int **esp\_bt\_gap\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** - >= 0 : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_bt\_gap\_get\_bond\_device\_list** (int \*dev\_num, *esp\_bd\_addr\_t* \*dev\_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [inout] dev\_num: Indicate the dev\_list array(buffer) size as input. If dev\_num is large enough, it means the actual number as output. Suggest that dev\_num value equal to

`esp_ble_get_bond_device_num()`.

- [out] `dev_list`: an array(buffer) of `esp_bd_addr_t` type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

*esp\_err\_t* **esp\_bt\_gap\_set\_pin** (*esp\_bt\_pin\_type\_t* pin\_type, *uint8\_t* pin\_code\_len, *esp\_bt\_pin\_code\_t* pin\_code)

Set pin type and default pin code for legacy pairing.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `pin_type`: Use variable or fixed pin. If `pin_type` is `ESP_BT_PIN_TYPE_VARIABLE`, `pin_code` and `pin_code_len` will be ignored, and `ESP_BT_GAP_PIN_REQ_EVT` will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- [in] `pin_code_len`: Length of `pin_code`
- [in] `pin_code`: Pin\_code

*esp\_err\_t* **esp\_bt\_gap\_pin\_reply** (*esp\_bd\_addr\_t* bd\_addr, *bool* accept, *uint8\_t* pin\_code\_len, *esp\_bt\_pin\_code\_t* pin\_code)

Reply the `pin_code` to the peer device for legacy pairing when `ESP_BT_GAP_PIN_REQ_EVT` is coming.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peer
- [in] `accept`: Pin\_code reply successful or declined.
- [in] `pin_code_len`: Length of `pin_code`
- [in] `pin_code`: Pin\_code

*esp\_err\_t* **esp\_bt\_gap\_set\_security\_param** (*esp\_bt\_sp\_param\_t* param\_type, *void* \*value, *uint8\_t* len)

Set a GAP security parameter value. Overrides the default value.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `param_type`: : the type of the param which is to be set
- [in] `value`: : the param value
- [in] `len`: : the length of the param value

*esp\_err\_t* **esp\_bt\_gap\_ssp\_passkey\_reply** (*esp\_bd\_addr\_t* bd\_addr, *bool* accept, *uint32\_t* passkey)

Reply the key value to the peer device in the legacy connection stage.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

*esp\_err\_t* **esp\_bt\_gap\_ssp\_confirm\_reply** (*esp\_bd\_addr\_t* bd\_addr, *bool* accept)

Reply the confirm value to the peer device in the legacy connection stage.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

*esp\_err\_t* **esp\_bt\_gap\_set\_afh\_channels** (*esp\_bt\_gap\_afh\_channels* channels)

Set the AFH channels.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] channels: : The n<sup>th</sup> such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

*esp\_err\_t* **esp\_bt\_gap\_read\_remote\_name** (*esp\_bd\_addr\_t* remote\_bda)

Read the remote device name.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] remote\_bda: The remote device' s address

*esp\_err\_t* **esp\_bt\_gap\_set\_qos** (*esp\_bd\_addr\_t* remote\_bda, *uint32\_t* t\_poll)

Config Quality of service.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] remote\_bda: The remote device' s address
- [in] t\_poll: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

EIR data include TX power, false by default

bool **include\_uuid**  
EIR data include UUID, false by default

uint8\_t **flag**  
EIR flags, see ESP\_BT\_EIR\_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16\_t **manufacturer\_len**  
Manufacturer data length, 0 by default

uint8\_t **\*p\_manufacturer\_data**  
Manufacturer data point

uint16\_t **url\_len**  
URL length, 0 by default

uint8\_t **\*p\_url**  
URL point

### Macros

**ESP\_BT\_GAP\_RSSI\_HIGH\_THRDL**  
RSSI threshold.

High RSSI threshold

**ESP\_BT\_GAP\_RSSI\_LOW\_THRDL**  
Low RSSI threshold

**ESP\_BT\_GAP\_AFH\_CHANNELS\_LEN**

**ESP\_BT\_GAP\_MAX\_BDNAME\_LEN**  
Maximum bytes of Bluetooth device name.

**ESP\_BT\_GAP\_EIR\_DATA\_LEN**  
Maximum size of EIR Significant part.

**ESP\_BT\_EIR\_TYPE\_FLAGS**  
Extended Inquiry Response data type.  
Flag with information such as BR/EDR and LE support

**ESP\_BT\_EIR\_TYPE\_INCMPL\_16BITS\_UUID**  
Incomplete list of 16-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_16BITS\_UUID**  
Complete list of 16-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_INCMPL\_32BITS\_UUID**

Incomplete list of 32-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_32BITS\_UUID**

Complete list of 32-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_INCMPL\_128BITS\_UUID**

Incomplete list of 128-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_128BITS\_UUID**

Complete list of 128-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_SHORT\_LOCAL\_NAME**

Shortened Local Name

**ESP\_BT\_EIR\_TYPE\_CMPL\_LOCAL\_NAME**

Complete Local Name

**ESP\_BT\_EIR\_TYPE\_TX\_POWER\_LEVEL**

Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

**ESP\_BT\_EIR\_TYPE\_URL**

Uniform resource identifier

**ESP\_BT\_EIR\_TYPE\_MANU\_SPECIFIC**

Manufacturer specific data

**ESP\_BT\_EIR\_TYPE\_MAX\_NUM**

MAX number of EIR type

**ESP\_BT\_EIR\_FLAG\_LIMIT\_DISC**

**ESP\_BT\_EIR\_FLAG\_GEN\_DISC**

**ESP\_BT\_EIR\_FLAG\_BREDR\_NOT\_SPT**

**ESP\_BT\_EIR\_FLAG\_DMT\_CONTROLLER\_SPT**

**ESP\_BT\_EIR\_FLAG\_DMT\_HOST\_SPT**

**ESP\_BT\_EIR\_MAX\_LEN**

**ESP\_BT\_IO\_CAP\_NONE**

**ESP\_BT\_COD\_SRVC\_BIT\_MASK**

Bits of major service class field.

Major service bit mask

**ESP\_BT\_COD\_SRVC\_BIT\_OFFSET**

Major service bit offset

**ESP\_BT\_COD\_MAJOR\_DEV\_BIT\_MASK**

Bits of major device class field.

Major device bit mask

**ESP\_BT\_COD\_MAJOR\_DEV\_BIT\_OFFSET**

Major device bit offset

**ESP\_BT\_COD\_MINOR\_DEV\_BIT\_MASK**

Bits of minor device class field.

Minor device bit mask

**ESP\_BT\_COD\_MINOR\_DEV\_BIT\_OFFSET**

Minor device bit offset

**ESP\_BT\_COD\_FORMAT\_TYPE\_BIT\_MASK**

Bits of format type.

Format type bit mask

**ESP\_BT\_COD\_FORMAT\_TYPE\_BIT\_OFFSET**

Format type bit offset

**ESP\_BT\_COD\_FORMAT\_TYPE\_1**

Class of device format type 1.

**ESP\_BT\_GAP\_MIN\_INQ\_LEN**

Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP\_BT\_GAP\_MAX\_INQ\_LEN**

Maximum inquiry duration, unit is 1.28s

**Type Definitions****typedef** uint8\_t **esp\_bt\_gap\_afh\_channels**[ESP\_BT\_GAP\_AFH\_CHANNELS\_LEN]**typedef** uint8\_t **esp\_bt\_eir\_type\_t****typedef** uint8\_t **esp\_bt\_pin\_code\_t**[ESP\_BT\_PIN\_CODE\_LEN]

Pin Code (upto 128 bits) MSB is 0

**typedef** uint8\_t **esp\_bt\_io\_cap\_t**

combination of the io capability

**typedef** void (\***esp\_bt\_gap\_cb\_t**) (*esp\_bt\_gap\_cb\_event\_t* event, *esp\_bt\_gap\_cb\_param\_t* \*param)

bluetooth GAP callback function type

**Parameters**

- event: : Event type
- param: : Pointer to callback parameter

**Enumerations****enum** **esp\_bt\_cod\_mode\_t**

class of device settings

*Values:***ESP\_BT\_SET\_COD\_MAJOR\_MINOR** = 0x01

overwrite major, minor class

**ESP\_BT\_SET\_COD\_SERVICE\_CLASS** = 0x02

set the bits in the input, the current bit will remain

**ESP\_BT\_CLR\_COD\_SERVICE\_CLASS** = 0x04

clear the bits in the input, others will remain

**ESP\_BT\_SET\_COD\_ALL** = 0x08

overwrite major, minor, set the bits in service class

**ESP\_BT\_INIT\_COD** = 0x0a

overwrite major, minor, and service class

**enum** **esp\_bt\_connection\_mode\_t**

Discoverability and Connectability mode.

*Values:*

**ESP\_BT\_NON\_CONNECTABLE**

Non-connectable

**ESP\_BT\_CONNECTABLE**

Connectable

**enum esp\_bt\_discovery\_mode\_t**

*Values:*

**ESP\_BT\_NON\_DISCOVERABLE**

Non-discoverable

**ESP\_BT\_LIMITED\_DISCOVERABLE**

Limited Discoverable

**ESP\_BT\_GENERAL\_DISCOVERABLE**

General Discoverable

**enum esp\_bt\_gap\_dev\_prop\_type\_t**

Bluetooth Device Property type.

*Values:*

**ESP\_BT\_GAP\_DEV\_PROP\_BDNAME = 1**

Bluetooth device name, value type is int8\_t []

**ESP\_BT\_GAP\_DEV\_PROP\_COD**

Class of Device, value type is uint32\_t

**ESP\_BT\_GAP\_DEV\_PROP\_RSSI**

Received Signal strength Indication, value type is int8\_t, ranging from -128 to 127

**ESP\_BT\_GAP\_DEV\_PROP\_EIR**

Extended Inquiry Response, value type is uint8\_t []

**enum esp\_bt\_cod\_srvc\_t**

Major service class field of Class of Device, mutiple bits can be set.

*Values:*

**ESP\_BT\_COD\_SRVC\_NONE = 0**

None indicates an invalid value

**ESP\_BT\_COD\_SRVC\_LMTD\_DISCOVER = 0x1**

Limited Discoverable Mode

**ESP\_BT\_COD\_SRVC\_POSITIONING = 0x8**

Positioning (Location identification)

**ESP\_BT\_COD\_SRVC\_NETWORKING = 0x10**

Networking, e.g. LAN, Ad hoc

**ESP\_BT\_COD\_SRVC\_RENDERING = 0x20**

Rendering, e.g. Printing, Speakers

**ESP\_BT\_COD\_SRVC\_CAPTURING = 0x40**

Capturing, e.g. Scanner, Microphone

**ESP\_BT\_COD\_SRVC\_OBJ\_TRANSFER = 0x80**

Object Transfer, e.g. v-Inbox, v-Folder

**ESP\_BT\_COD\_SRVC\_AUDIO = 0x100**

Audio, e.g. Speaker, Microphone, Headset service

**ESP\_BT\_COD\_SRVC\_TELEPHONY = 0x200**

Telephony, e.g. Cordless telephony, Modem, Headset service

**ESP\_BT\_COD\_SRVC\_INFORMATION = 0x400**

Information, e.g., WEB-server, WAP-server

**enum esp\_bt\_pin\_type\_t***Values:***ESP\_BT\_PIN\_TYPE\_VARIABLE = 0**  
Refer to BTM\_PIN\_TYPE\_VARIABLE**ESP\_BT\_PIN\_TYPE\_FIXED = 1**  
Refer to BTM\_PIN\_TYPE\_FIXED**enum esp\_bt\_sp\_param\_t***Values:***ESP\_BT\_SP\_IOCTL\_MODE = 0**  
Set IO mode**enum esp\_bt\_cod\_major\_dev\_t**

Major device class field of Class of Device.

**ESP\_BT\_GAP\_READ\_REMOTE\_NAME\_EVT**  
read Remote Name event

**ESP\_BT\_GAP\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**  
remove bond device complete event

**ESP\_BT\_GAP\_QOS\_CMPL\_EVT**  
QOS complete event

**ESP\_BT\_GAP\_EVT\_MAX**

**enum esp\_bt\_inq\_mode\_t**  
Inquiry Mode

*Values:*

**ESP\_BT\_INQ\_MODE\_GENERAL\_INQUIRY**  
General inquiry mode

**ESP\_BT\_INQ\_MODE\_LIMITED\_INQUIRY**  
Limited inquiry mode

## Bluetooth A2DP API

**Overview** [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/classic\\_bt](#) folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - [bluetooth/bluedroid/classic\\_bt/a2dp\\_sink](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_a2dp\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_a2d\_register\_callback** (*esp\_a2d\_cb\_t* callback)

Register application callback function to A2DP module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by both A2DP source and sink.

#### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

#### Parameters

- [in] callback: A2DP event callback function

*esp\_err\_t* **esp\_a2d\_sink\_register\_data\_callback** (*esp\_a2d\_sink\_data\_cb\_t* callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after `esp_bluedroid_enable()` completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through `menuconfig`.

#### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

#### Parameters

- [in] callback: A2DP sink data callback function

*esp\_err\_t* **esp\_a2d\_sink\_init** (void)

Initialize the bluetooth A2DP sink module. This function should be called after `esp_bluedroid_enable()` completes successfully, and ESP\_A2D\_PROF\_STATE\_EVT with ESP\_A2D\_INIT\_SUCCESS will be reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

#### Return

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_deinit** (void)

De-initialize for A2DP sink module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and ESP\_A2D\_PROF\_STATE\_EVT with ESP\_A2D\_DEINIT\_SUCCESS will be reported to APP layer.

#### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth A2DP source device, must after `esp_a2d_sink_init()`

#### Return

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_a2d\_sink\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote A2DP source device.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_a2d\_media\_ctrl** (*esp\_a2d\_media\_ctrl\_t* ctrl)

media control commands; this API can be used for both A2DP sink and source

**Return**

- ESP\_OK: control command is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] ctrl: control commands for A2DP data channel

*esp\_err\_t* **esp\_a2d\_source\_init** (void)

Initialize the bluetooth A2DP source module. This function should be called after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT` with `ESP_A2D_INIT_SUCCESS` will be reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

**Return**

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_source\_deinit** (void)

De-initialize for A2DP source module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT` with `ESP_A2D_DEINIT_SUCCESS` will be reported to APP layer.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_source\_register\_data\_callback** (*esp\_a2d\_source\_data\_cb\_t* callback)

Register A2DP source data input function; For now the input is PCM data stream. This function should be called only after `esp_bluedroid_enable()` completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through `menuconfig`.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

**Parameters**

- [in] callback: A2DP source data callback function

*esp\_err\_t* **esp\_a2d\_source\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote A2DP sink device, must after `esp_a2d_source_init()`

**Return**

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_a2d\_source\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote A2DP sink device.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_bda: remote bluetooth device address

### Unions

**union esp\_a2d\_cb\_param\_t**

*#include <esp\_a2dp\_api.h>* A2DP state callback parameters.

#### Public Members

**struct esp\_a2d\_cb\_param\_t::a2d\_conn\_stat\_param** **conn\_stat**

A2DP connection status

**struct esp\_a2d\_cb\_param\_t::a2d\_audio\_stat\_param** **audio\_stat**

audio stream playing state

**struct esp\_a2d\_cb\_param\_t::a2d\_audio\_cfg\_param** **audio\_cfg**

media codec configuration information

**struct esp\_a2d\_cb\_param\_t::media\_ctrl\_stat\_param** **media\_ctrl\_stat**

status in acknowledgement to media control commands

**struct esp\_a2d\_cb\_param\_t::a2d\_prof\_stat\_param** **a2d\_prof\_stat**

status to indicate a2d prof init or deinit

**struct a2d\_audio\_cfg\_param**

*#include <esp\_a2dp\_api.h>* ESP\_A2D\_AUDIO\_CFG\_EVT.

#### Public Members

*esp\_bd\_addr\_t* **remote\_bda**

remote bluetooth device address

*esp\_a2d\_mcc\_t* **mcc**

A2DP media codec capability information

**struct a2d\_audio\_stat\_param**

*#include <esp\_a2dp\_api.h>* ESP\_A2D\_AUDIO\_STATE\_EVT.

#### Public Members

*esp\_a2d\_audio\_state\_t* **state**

one of the values from esp\_a2d\_audio\_state\_t

*esp\_bd\_addr\_t* **remote\_bda**

remote bluetooth device address

**struct a2d\_conn\_stat\_param**

*#include <esp\_a2dp\_api.h>* ESP\_A2D\_CONNECTION\_STATE\_EVT.

### Public Members

*esp\_a2d\_connection\_state\_t* **state**  
one of values from *esp\_a2d\_connection\_state\_t*

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

*esp\_a2d\_disc\_rsn\_t* **disc\_rsn**  
reason of disconnection for “DISCONNECTED”

**struct a2d\_prof\_stat\_param**  
*#include <esp\_a2dp\_api.h>* ESP\_A2D\_PROF\_STATE\_EVT.

### Public Members

*esp\_a2d\_init\_state\_t* **init\_state**  
a2dp profile state param

**struct media\_ctrl\_stat\_param**  
*#include <esp\_a2dp\_api.h>* ESP\_A2D\_MEDIA\_CTRL\_ACK\_EVT.

### Public Members

*esp\_a2d\_media\_ctrl\_t* **cmd**  
media control commands to acknowledge

*esp\_a2d\_media\_ctrl\_ack\_t* **status**  
acknowledgement to media control commands

### Structures

**struct esp\_a2d\_mcc\_t**  
A2DP media codec capabilities union.

### Public Members

*esp\_a2d\_mct\_t* **type**  
A2DP media codec type

**union esp\_a2d\_mcc\_t::[anonymous] cie**  
A2DP codec information element

### Macros

**ESP\_A2D\_MCT\_SBC**  
Media codec types supported by A2DP.

SBC

**ESP\_A2D\_MCT\_M12**  
MPEG-1, 2 Audio

**ESP\_A2D\_MCT\_M24**  
MPEG-2, 4 AAC

**ESP\_A2D\_MCT\_ATRAC**  
ATRAC family

**ESP\_A2D\_MCT\_NON\_A2DP**

**ESP\_A2D\_CIE\_LEN\_SBC**

**ESP\_A2D\_CIE\_LEN\_M12****ESP\_A2D\_CIE\_LEN\_M24****ESP\_A2D\_CIE\_LEN\_ATRAC**

### Type Definitions

**typedef** uint8\_t **esp\_a2d\_mct\_t****typedef** void (\***esp\_a2d\_cb\_t**) (*esp\_a2d\_cb\_event\_t* event, *esp\_a2d\_cb\_param\_t* \*param)  
A2DP profile callback function type.

#### Parameters

- *event*: : Event type
- *param*: : Pointer to callback parameter

**typedef** void (\***esp\_a2d\_sink\_data\_cb\_t**) (**const** uint8\_t \*buf, uint32\_t len)

A2DP profile data callback function.

#### Parameters

- [*in*] *buf*: : data received from A2DP source device and is PCM format decoder from SBC decoder; *buf* references to a static memory block and can be overwritten by upcoming data
- [*in*] *len*: : size(in bytes) in *buf*

**typedef** int32\_t (\***esp\_a2d\_source\_data\_cb\_t**) (uint8\_t \*buf, int32\_t len)

A2DP source data read callback function.

**Return** size of bytes read successfully, if the argument *len* is -1, this value is ignored.

#### Parameters

- [*in*] *buf*: : buffer to be filled with PCM data stream from higher layer
- [*in*] *len*: : size(in bytes) of data block to be copied to *buf*. -1 is an indication to user that data buffer shall be flushed

### Enumerations

**enum** **esp\_a2d\_connection\_state\_t**

Bluetooth A2DP connection states.

*Values:***ESP\_A2D\_CONNECTION\_STATE\_DISCONNECTED** = 0  
connection released**ESP\_A2D\_CONNECTION\_STATE\_CONNECTING**  
connecting remote device**ESP\_A2D\_CONNECTION\_STATE\_CONNECTED**  
connection established**ESP\_A2D\_CONNECTION\_STATE\_DISCONNECTING**  
disconnecting remote device**enum** **esp\_a2d\_disc\_rsn\_t**

Bluetooth A2DP disconnection reason.

*Values:***ESP\_A2D\_DISC\_RSN\_NORMAL** = 0  
Finished disconnection that is initiated by local or remote device**ESP\_A2D\_DISC\_RSN\_ABNORMAL**  
Abnormal disconnection caused by signal loss**enum** **esp\_a2d\_audio\_state\_t**

Bluetooth A2DP datapath states.

*Values:*

**ESP\_A2D\_AUDIO\_STATE\_REMOTE\_SUSPEND = 0**  
audio stream datapath suspended by remote device

**ESP\_A2D\_AUDIO\_STATE\_STOPPED**  
audio stream datapath stopped

**ESP\_A2D\_AUDIO\_STATE\_STARTED**  
audio stream datapath started

**enum esp\_a2d\_media\_ctrl\_ack\_t**  
A2DP media control command acknowledgement code.

*Values:*

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_SUCCESS = 0**  
media control command is acknowledged with success

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_FAILURE**  
media control command is acknowledged with failure

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_BUSY**  
media control command is rejected, as previous command is not yet acknowledged

**enum esp\_a2d\_media\_ctrl\_t**  
A2DP media control commands.

*Values:*

**ESP\_A2D\_MEDIA\_CTRL\_NONE = 0**  
Not for application use, use inside stack only.

**ESP\_A2D\_MEDIA\_CTRL\_CHECK\_SRC\_RDY**  
check whether AVDTP is connected, only used in A2DP source

**ESP\_A2D\_MEDIA\_CTRL\_START**  
command to set up media transmission channel

**ESP\_A2D\_MEDIA\_CTRL\_STOP**  
command to stop media transmission

**ESP\_A2D\_MEDIA\_CTRL\_SUSPEND**  
command to suspend media transmission

**enum esp\_a2d\_init\_state\_t**  
Bluetooth A2DP Initiation states.

*Values:*

**ESP\_A2D\_DEINIT\_SUCCESS = 0**  
A2DP profile deinit successful event

**ESP\_A2D\_INIT\_SUCCESS**  
A2DP profile deinit successful event

**enum esp\_a2d\_cb\_event\_t**  
A2DP callback events.

*Values:*

**ESP\_A2D\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event

**ESP\_A2D\_AUDIO\_STATE\_EVT**  
audio stream transmission state changed event

**ESP\_A2D\_AUDIO\_CFG\_EVT**  
audio codec is configured, only used for A2DP SINK

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_EVT**  
acknowledge event in response to media control commands

**ESP\_A2D\_PROF\_STATE\_EVT**

indicate a2dp init&amp;deinit complete

**BT AVRCP APIs****Overview** Bluetooth AVRCP reference APIs.[Instructions](#)**Application Example** [Instructions](#)**API Reference****Header File**

- [bt/host/bluedroid/api/include/api/esp\\_avrc\\_api.h](#)

**Functions***esp\_err\_t* **esp\_avrc\_ct\_register\_callback** (*esp\_avrc\_ct\_cb\_t* callback)Register application callbacks to AVRCP module. This function should be called after `esp_bluedroid_enable()` completes successfully.**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] callback: AVRCP controller callback function

*esp\_err\_t* **esp\_avrc\_ct\_init** (void)Initialize the bluetooth AVRCP controller module, This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_ct\_deinit** (void)De-initialize AVRCP controller module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_ct\_send\_set\_player\_value\_cmd** (uint8\_t *tl*, uint8\_t *attr\_id*, uint8\_t *value\_id*)Send player application settings command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *tl*: transaction label, 0 to 15, consecutive commands should use different values.

- [in] `attr_id`: : player application setting attribute IDs from one of `esp_avrc_ps_attr_ids_t`
- [in] `value_id`: : attribute value defined for the specific player application setting attribute

*esp\_err\_t* `esp_avrc_ct_send_get_rn_capabilities_cmd` (uint8\_t *tl*)

Send GetCapabilities PDU to AVRCP target to retrieve remote device's supported notification event\_ids. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

#### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

#### Parameters

- [in] `tl`: : transaction label, 0 to 15, consecutive commands should use different values.

*esp\_err\_t* `esp_avrc_ct_send_register_notification_cmd` (uint8\_t *tl*, uint8\_t *event\_id*, uint32\_t *event\_parameter*)

Send register notification command to AVRCP target, This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

#### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_ERR_NOT_SUPPORTED`: if the event\_id is not supported in current implementation
- `ESP_FAIL`: others

#### Parameters

- [in] `tl`: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] `event_id`: : id of events, e.g. `ESP_AVRC_RN_PLAY_STATUS_CHANGE`, `ESP_AVRC_RN_TRACK_CHANGE`, etc.
- [in] `event_parameter`: : playback interval for `ESP_AVRC_RN_PLAY_POS_CHANGED`; For other events, value of this parameter is ignored.

*esp\_err\_t* `esp_avrc_ct_send_set_absolute_volume_cmd` (uint8\_t *tl*, uint8\_t *volume*)

Send set absolute volume command to AVRCP target, This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

#### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_ERR_NOT_SUPPORTED`: if the event\_id is not supported in current implementation
- `ESP_FAIL`: others

#### Parameters

- [in] `tl`: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] `volume`: : volume, 0 to 0x7f, means 0% to 100%

*esp\_err\_t* `esp_avrc_ct_send_metadata_cmd` (uint8\_t *tl*, uint8\_t *attr\_mask*)

Send metadata command to AVRCP target, This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

#### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

#### Parameters

- [in] `tl`: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] `attr_mask`: : mask of attributes, e.g. `ESP_AVRC_MD_ATTR_ID_TITLE` | `ESP_AVRC_MD_ATTR_ID_ARTIST`.

*esp\_err\_t* `esp_avrc_ct_send_passthrough_cmd` (uint8\_t *tl*, uint8\_t *key\_code*, uint8\_t *key\_state*)

Send passthrough command to AVRCP target, This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
- [in] `key_code`: passthrough command code, e.g. ESP\_AVRC\_PT\_CMD\_PLAY, ESP\_AVRC\_PT\_CMD\_STOP, etc.
- [in] `key_state`: passthrough command key state, ESP\_AVRC\_PT\_CMD\_STATE\_PRESSED or ESP\_AVRC\_PT\_CMD\_STATE\_RELEASED

*esp\_err\_t* **esp\_avrc\_tg\_register\_callback** (*esp\_avrc\_tg\_cb\_t* callback)

Register application callbacks to AVRCP target module; This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `callback`: AVRCP target callback function

*esp\_err\_t* **esp\_avrc\_tg\_init** (void)

Initialize the bluetooth AVRCP target module, This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_tg\_deinit** (void)

De-initialize AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_tg\_get\_psth\_cmd\_filter** (*esp\_avrc\_psth\_filter\_t* filter, *esp\_avrc\_psth\_bit\_mask\_t* \*cmd\_set)

Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. For filter type ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP\_AVRC\_PSTH\_FILTER\_SUPPORT\_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using `esp_avrc_tg_set_psth_cmd_filter()`

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP\_ERR\_INVALID\_ARG: if filter type is invalid or cmd\_set is NULL
- ESP\_FAIL: otherwise

*esp\_err\_t* **esp\_avrc\_tg\_set\_psth\_cmd\_filter** (*esp\_avrc\_psth\_filter\_t* filter, *esp\_avrc\_psth\_bit\_mask\_t* \*cmd\_set, const

Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. If filter type is ESP\_AVRC\_PSTH\_FILTER\_SUPPORT\_CMD, the passthrough commands which are set "1" as given in

cmd\_set will generate ESP\_AVRC\_CT\_PASSTHROUGH\_RSP\_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp\_avrc\_tg\_get\_psth\_cmd\_filter() with filter type “ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD”

Filter type “ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD” does not apply to this function

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled
- ESP\_ERR\_INVALID\_ARG: if filter type is invalid or cmd\_set is NULL
- ESP\_ERR\_NOT\_SUPPORTED: if filter type is ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD, or cmd\_set includes unallowed commands

```
bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                                     esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)
```

Operate on the type *esp\_avrc\_psth\_bit\_mask\_t* with regard to a specific PASSTHROUGH command.

**Return** For operation ESP\_AVRC\_BIT\_MASK\_OP\_SET or ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR, return true for a successful operation, otherwise return false For operation ESP\_AVRC\_BIT\_MASK\_OP\_TEST, return true if the corresponding bit is set, otherwise false

#### Parameters

- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code

```
esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in evt\_set. This function should be called after esp\_avrc\_tg\_init(). For capability type “ESP\_AVRC\_RN\_CAP\_ALLOWED\_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation. For capability type ESP\_AVRC\_RN\_CAP\_SUPPORTED\_EVT, the event set covers the notification events selected to be supported under current configuration, The configuration can be changed using esp\_avrc\_tg\_set\_rn\_evt\_cap()

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP\_ERR\_INVALID\_ARG: if cap is invalid or evt\_set is NULL
- ESP\_FAIL: otherwise

```
esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in evt\_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp\_avrc\_tg\_init().

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled
- ESP\_ERR\_INVALID\_ARG: if evt\_set is NULL

```
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                                       esp_avrc_rn_evt_cap_mask_t *events,
                                       esp_avrc_rn_event_ids_t event_id)
```

Operate on the type *esp\_avrc\_rn\_evt\_cap\_mask\_t* with regard to a specific event.

**Return** For operation ESP\_AVRC\_BIT\_MASK\_OP\_SET or ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR, return true for a successful operation, otherwise return false For operation ESP\_AVRC\_BIT\_MASK\_OP\_TEST, return true if the corresponding bit is set, otherwise false

#### Parameters

- [in] op: operation requested on the bit mask field
- [in] events: pointer to event notification capability bit mask structure

- [in] `event_id`: notification event code

`esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)`

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`

#### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not enabled or AVRCP TG is not initialized
- `ESP_ERR_INVALID_ARG`: if `evt_set` is NULL

#### Parameters

- [in] `event_id`: notification event ID that remote AVRCP CT registers
- [in] `rsp`: notification response code
- [in] `param`: parameters included in the specific notification

## Unions

**union** `esp_avrc_rn_param_t`

`#include <esp_avrc_api.h>` AVRCP notification parameters.

#### Public Members

`uint8_t volume`

response data for `ESP_AVRC_RN_VOLUME_CHANGE`, ranges 0..127

`esp_avrc_playback_stat_t playback`

response data for `ESP_AVRC_RN_PLAY_STATUS_CHANGE`

`uint8_t elm_id[8]`

response data for `ESP_AVRC_RN_TRACK_CHANGE`

`uint32_t play_pos`

response data for `ESP_AVRC_RN_PLAY_POS_CHANGED`, in millisecond

`esp_avrc_batt_stat_t batt`

response data for `ESP_AVRC_RN_BATTERY_STATUS_CHANGE`

**union** `esp_avrc_ct_cb_param_t`

`#include <esp_avrc_api.h>` AVRCP controller callback parameters.

#### Public Members

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat`

AVRC connection status

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp`

passthrough command response

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp`

metadata attributes response

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf`

notifications

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats`

AVRC features discovered from remote SDP server

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp`

get supported event capabilities response from AVRCP target

**struct** `esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp`

set absolute volume response event

```
struct avrc_ct_change_notify_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.
```

### Public Members

**uint8\_t event\_id**  
id of AVRC event notification

*esp\_avrc\_rm\_param\_t* **event\_parameter**  
event notification parameter

```
struct avrc_ct_conn_stat_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.
```

### Public Members

**bool connected**  
whether AVRC connection is set up

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

```
struct avrc_ct_get_rn_caps_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.
```

### Public Members

**uint8\_t cap\_count**  
number of items provided in event or company\_id according to cap\_id used

*esp\_avrc\_rm\_evt\_cap\_mask\_t* **evt\_set**  
supported event\_ids represented in bit-mask

```
struct avrc_ct_meta_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
```

### Public Members

**uint8\_t attr\_id**  
id of metadata attribute

**uint8\_t \*attr\_text**  
attribute itself

**int attr\_length**  
attribute character length

```
struct avrc_ct_psth_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

### Public Members

**uint8\_t t1**  
transaction label, 0 to 15

**uint8\_t key\_code**  
passthrough command code

**uint8\_t key\_state**  
0 for PRESSED, 1 for RELEASED

**struct avrc\_ct\_rmt\_feats\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_CT\_REMOTE\_FEATURES\_EVT.

### Public Members

**uint32\_t feat\_mask**  
AVRC feature mask of remote device

**uint16\_t tg\_feat\_flag**  
feature flag of remote device as TG

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

**struct avrc\_ct\_set\_volume\_rsp\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_CT\_SET\_ABSOLUTE\_VOLUME\_RSP\_EVT.

### Public Members

**uint8\_t volume**  
the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%

**union esp\_avrc\_tg\_cb\_param\_t**  
*#include <esp\_avrc\_api.h>* AVRC target callback parameters.

### Public Members

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_conn\_stat\_param conn\_stat**  
AVRC connection status

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_rmt\_feats\_param rmt\_feats**  
AVRC features discovered through SDP

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_psth\_cmd\_param psth\_cmd**  
passthrough command

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_set\_abs\_vol\_param set\_abs\_vol**  
set absolute volume command targeted on audio sink

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_reg\_ntf\_param reg\_ntf**  
register notification

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_set\_app\_value\_param set\_app\_value**  
set player application value

**struct avrc\_tg\_conn\_stat\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_CONNECTION\_STATE\_EVT.

### Public Members

**bool connected**  
whether AVRC connection is set up

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

**struct avrc\_tg\_psth\_cmd\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_PASSTHROUGH\_CMD\_EVT.

**Public Members**

**uint8\_t key\_code**  
passthrough command code

**uint8\_t key\_state**  
0 for PRESSED, 1 for RELEASED

**struct avrc\_tg\_reg\_ntf\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_REGISTER\_NOTIFICATION\_EVT.

**Public Members**

**uint8\_t event\_id**  
event id of AVRC RegisterNotification

**uint32\_t event\_parameter**  
event notification parameter

**struct avrc\_tg\_rmt\_feats\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_REMOTE\_FEATURES\_EVT.

**Public Members**

**uint32\_t feat\_mask**  
AVRC feature mask of remote device

**uint16\_t ct\_feat\_flag**  
feature flag of remote device as CT

**esp\_bd\_addr\_t remote\_bda**  
remote bluetooth device address

**struct avrc\_tg\_set\_abs\_vol\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_SET\_ABSOLUTE\_VOLUME\_CMD\_EVT.

**Public Members**

**uint8\_t volume**  
volume ranges from 0 to 127

**struct avrc\_tg\_set\_app\_value\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_SET\_PLAYER\_APP\_VALUE\_EVT.

**Public Members**

**uint8\_t num\_val**  
attribute num

**esp\_avrc\_set\_app\_value\_param\_t \*p\_vals**  
point to the id and value of player application attribute

**Structures**

**struct esp\_avrc\_psth\_bit\_mask\_t**  
AVRC passthrough command bit mask.

### Public Members

`uint16_t bits[8]`  
bit mask representation of PASSTHROUGH commands

**struct esp\_avrc\_rn\_evt\_cap\_mask\_t**  
AVRC target notification event capability bit mask.

### Public Members

`uint16_t bits`  
bit mask representation of PASSTHROUGH commands

**struct esp\_avrc\_set\_app\_value\_param\_t**  
AVRCP set app value parameters.

### Public Members

`uint8_t attr_id`  
player application attribute id

`uint8_t attr_val`  
player application attribute value

### Macros

**ESP\_AVRC\_TRANS\_LABEL\_MAX**  
max transaction label

### Type Definitions

**typedef void (\*esp\_avrc\_ct\_cb\_t)** (*esp\_avrc\_ct\_cb\_event\_t* event, *esp\_avrc\_ct\_cb\_param\_t* \*param)  
AVRCP controller callback function type.

#### Parameters

- *event*: : Event type
- *param*: : Pointer to callback parameter union

**typedef void (\*esp\_avrc\_tg\_cb\_t)** (*esp\_avrc\_tg\_cb\_event\_t* event, *esp\_avrc\_tg\_cb\_param\_t* \*param)  
AVRCP target callback function type.

#### Parameters

- *event*: : Event type
- *param*: : Pointer to callback parameter union

### Enumerations

**enum esp\_avrc\_features\_t**  
AVRC feature bit mask.

#### Values:

**ESP\_AVRC\_FEAT\_RCTG** = 0x0001  
remote control target

**ESP\_AVRC\_FEAT\_RCCT** = 0x0002  
remote control controller

**ESP\_AVRC\_FEAT\_VENDOR** = 0x0008  
remote control vendor dependent commands

**ESP\_AVRC\_FEAT\_BROWSE** = 0x0010  
use browsing channel

**ESP\_AVRC\_FEAT\_META\_DATA** = 0x0040  
remote control metadata transfer command/response

**ESP\_AVRC\_FEAT\_ADV\_CTRL** = 0x0200  
remote control advanced control command/response

**enum esp\_avrc\_feature\_flag\_t**  
AVRC supported features flag retrieved in SDP record.

*Values:*

**ESP\_AVRC\_FEAT\_FLAG\_CAT1** = 0x0001  
category 1

**ESP\_AVRC\_FEAT\_FLAG\_CAT2** = 0x0002  
category 2

**ESP\_AVRC\_FEAT\_FLAG\_CAT3** = 0x0004  
category 3

**ESP\_AVRC\_FEAT\_FLAG\_CAT4** = 0x0008  
category 4

**ESP\_AVRC\_FEAT\_FLAG\_BROWSING** = 0x0040  
browsing

**ESP\_AVRC\_FEAT\_FLAG\_COVER\_ART\_GET\_IMAGE\_PROP** = 0x0080  
Cover Art GetImageProperties

**ESP\_AVRC\_FEAT\_FLAG\_COVER\_ART\_GET\_IMAGE** = 0x0100  
Cover Art GetImage

**ESP\_AVRC\_FEAT\_FLAG\_COVER\_ART\_GET\_LINKED\_THUMBNAIL** = 0x0200  
Cover Art GetLinkedThumbnail

**enum esp\_avrc\_pt\_cmd\_t**  
AVRC passthrough command code.

*Values:*

**ESP\_AVRC\_PT\_CMD\_SELECT** = 0x00  
select

**ESP\_AVRC\_PT\_CMD\_UP** = 0x01  
up

**ESP\_AVRC\_PT\_CMD\_DOWN** = 0x02  
down

**ESP\_AVRC\_PT\_CMD\_LEFT** = 0x03  
left

**ESP\_AVRC\_PT\_CMD\_RIGHT** = 0x04  
right

**ESP\_AVRC\_PT\_CMD\_RIGHT\_UP** = 0x05  
right-up

**ESP\_AVRC\_PT\_CMD\_RIGHT\_DOWN** = 0x06  
right-down

**ESP\_AVRC\_PT\_CMD\_LEFT\_UP** = 0x07  
left-up

**ESP\_AVRC\_PT\_CMD\_LEFT\_DOWN** = 0x08  
left-down

**ESP\_AVRC\_PT\_CMD\_ROOT\_MENU** = 0x09  
root menu

**ESP\_AVRC\_PT\_CMD\_SETUP\_MENU** = 0x0A  
setup menu

**ESP\_AVRC\_PT\_CMD\_CONT\_MENU** = 0x0B  
contents menu

**ESP\_AVRC\_PT\_CMD\_FAV\_MENU** = 0x0C  
favorite menu

**ESP\_AVRC\_PT\_CMD\_EXIT** = 0x0D  
exit

**ESP\_AVRC\_PT\_CMD\_0** = 0x20  
0

**ESP\_AVRC\_PT\_CMD\_1** = 0x21  
1

**ESP\_AVRC\_PT\_CMD\_2** = 0x22  
2

**ESP\_AVRC\_PT\_CMD\_3** = 0x23  
3

**ESP\_AVRC\_PT\_CMD\_4** = 0x24  
4

**ESP\_AVRC\_PT\_CMD\_5** = 0x25  
5

**ESP\_AVRC\_PT\_CMD\_6** = 0x26  
6

**ESP\_AVRC\_PT\_CMD\_7** = 0x27  
7

**ESP\_AVRC\_PT\_CMD\_8** = 0x28  
8

**ESP\_AVRC\_PT\_CMD\_9** = 0x29  
9

**ESP\_AVRC\_PT\_CMD\_DOT** = 0x2A  
dot

**ESP\_AVRC\_PT\_CMD\_ENTER** = 0x2B  
enter

**ESP\_AVRC\_PT\_CMD\_CLEAR** = 0x2C  
clear

**ESP\_AVRC\_PT\_CMD\_CHAN\_UP** = 0x30  
channel up

**ESP\_AVRC\_PT\_CMD\_CHAN\_DOWN** = 0x31  
channel down

**ESP\_AVRC\_PT\_CMD\_PREV\_CHAN** = 0x32  
previous channel

**ESP\_AVRC\_PT\_CMD\_SOUND\_SEL** = 0x33  
sound select

**ESP\_AVRC\_PT\_CMD\_INPUT\_SEL** = 0x34  
input select

**ESP\_AVRC\_PT\_CMD\_DISP\_INFO** = 0x35  
display information

**ESP\_AVRC\_PT\_CMD\_HELP** = 0x36  
help

**ESP\_AVRC\_PT\_CMD\_PAGE\_UP** = 0x37  
page up

**ESP\_AVRC\_PT\_CMD\_PAGE\_DOWN** = 0x38  
page down

**ESP\_AVRC\_PT\_CMD\_POWER** = 0x40  
power

**ESP\_AVRC\_PT\_CMD\_VOL\_UP** = 0x41  
volume up

**ESP\_AVRC\_PT\_CMD\_VOL\_DOWN** = 0x42  
volume down

**ESP\_AVRC\_PT\_CMD\_MUTE** = 0x43  
mute

**ESP\_AVRC\_PT\_CMD\_PLAY** = 0x44  
play

**ESP\_AVRC\_PT\_CMD\_STOP** = 0x45  
stop

**ESP\_AVRC\_PT\_CMD\_PAUSE** = 0x46  
pause

**ESP\_AVRC\_PT\_CMD\_RECORD** = 0x47  
record

**ESP\_AVRC\_PT\_CMD\_REWIND** = 0x48  
rewind

**ESP\_AVRC\_PT\_CMD\_FAST\_FORWARD** = 0x49  
fast forward

**ESP\_AVRC\_PT\_CMD\_EJECT** = 0x4A  
eject

**ESP\_AVRC\_PT\_CMD\_FORWARD** = 0x4B  
forward

**ESP\_AVRC\_PT\_CMD\_BACKWARD** = 0x4C  
backward

**ESP\_AVRC\_PT\_CMD\_ANGLE** = 0x50  
angle

**ESP\_AVRC\_PT\_CMD\_SUBPICT** = 0x51  
subpicture

**ESP\_AVRC\_PT\_CMD\_F1** = 0x71  
F1

**ESP\_AVRC\_PT\_CMD\_F2** = 0x72  
F2

**ESP\_AVRC\_PT\_CMD\_F3** = 0x73  
F3

**ESP\_AVRC\_PT\_CMD\_F4** = 0x74  
F4

**ESP\_AVRC\_PT\_CMD\_F5** = 0x75  
F5

**ESP\_AVRC\_PT\_CMD\_VENDOR** = 0x7E  
vendor unique

**enum esp\_avrc\_psth\_filter\_t**  
AVRC passthrough command filter.

*Values:*

**ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD** = 0  
all of the PASSTHROUGH commands that can possibly be used, immutable

**ESP\_AVRC\_PSTH\_FILTER\_SUPPORTED\_CMD** = 1  
PASSTHROUGH commands selectively supported according to the current configuration

**ESP\_AVRC\_PSTH\_FILTER\_SUPPORT\_MAX**

**enum esp\_avrc\_bit\_mask\_op\_t**

*Values:*

**ESP\_AVRC\_BIT\_MASK\_OP\_TEST** = 0  
operation code to test a specific bit

**ESP\_AVRC\_BIT\_MASK\_OP\_SET** = 1  
operation code to set a specific bit

**ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR** = 2  
operation code to clear a specific bit

**enum esp\_avrc\_pt\_cmd\_state\_t**  
AVRC passthrough command state.

*Values:*

**ESP\_AVRC\_PT\_CMD\_STATE\_PRESSED** = 0  
key pressed

**ESP\_AVRC\_PT\_CMD\_STATE\_RELEASED** = 1  
key released

**enum esp\_avrc\_ct\_cb\_event\_t**

AVRC Controller callback events.

*Values:*

**ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT** = 0  
connection state changed event

**ESP\_AVRC\_CT\_PASSTHROUGH\_RSP\_EVT** = 1  
passthrough response event

**ESP\_AVRC\_CT\_METADATA\_RSP\_EVT** = 2  
metadata response event

**ESP\_AVRC\_CT\_PLAY\_STATUS\_RSP\_EVT** = 3  
play status response event

**ESP\_AVRC\_CT\_CHANGE\_NOTIFY\_EVT** = 4  
notification event

**ESP\_AVRC\_CT\_REMOTE\_FEATURES\_EVT** = 5  
feature of remote device indication event

**ESP\_AVRC\_CT\_GET\_RN\_CAPABILITIES\_RSP\_EVT** = 6  
supported notification events capability of peer device

**ESP\_AVRC\_CT\_SET\_ABSOLUTE\_VOLUME\_RSP\_EVT** = 7  
set absolute volume response event

**enum esp\_avrc\_tg\_cb\_event\_t**

AVRC Target callback events.

*Values:***ESP\_AVRC\_TG\_CONNECTION\_STATE\_EVT = 0**

connection state changed event

**ESP\_AVRC\_TG\_REMOTE\_FEATURES\_EVT = 1**

feature of remote device indication event

**ESP\_AVRC\_TG\_PASSTHROUGH\_CMD\_EVT = 2**

passthrough command event

**ESP\_AVRC\_TG\_SET\_ABSOLUTE\_VOLUME\_CMD\_EVT = 3**

set absolute volume command from remote device

**ESP\_AVRC\_TG\_REGISTER\_NOTIFICATION\_EVT = 4**

register notification event

**ESP\_AVRC\_TG\_SET\_PLAYER\_APP\_VALUE\_EVT = 5**

set application attribute value, attribute refer to esp\_avrc\_ps\_attr\_ids\_t

**enum esp\_avrc\_md\_attr\_mask\_t**

AVRC metadata attribute mask.

*Values:***ESP\_AVRC\_MD\_ATTR\_TITLE = 0x1**

title of the playing track

**ESP\_AVRC\_MD\_ATTR\_ARTIST = 0x2**

track artist

**ESP\_AVRC\_MD\_ATTR\_ALBUM = 0x4**

album name

**ESP\_AVRC\_MD\_ATTR\_TRACK\_NUM = 0x8**

track position on the album

**ESP\_AVRC\_MD\_ATTR\_NUM\_TRACKS = 0x10**

number of tracks on the album

**ESP\_AVRC\_MD\_ATTR\_GENRE = 0x20**

track genre

**ESP\_AVRC\_MD\_ATTR\_PLAYING\_TIME = 0x40**

total album playing time in milliseconds

**enum esp\_avrc\_rn\_event\_ids\_t**

AVRC event notification ids.

*Values:***ESP\_AVRC\_RN\_PLAY\_STATUS\_CHANGE = 0x01**

track status change, eg. from playing to paused

**ESP\_AVRC\_RN\_TRACK\_CHANGE = 0x02**

new track is loaded

**ESP\_AVRC\_RN\_TRACK\_REACHED\_END = 0x03**

current track reached end

**ESP\_AVRC\_RN\_TRACK\_REACHED\_START = 0x04**

current track reached start position

**ESP\_AVRC\_RN\_PLAY\_POS\_CHANGED = 0x05**

track playing position changed

**ESP\_AVRC\_RN\_BATTERY\_STATUS\_CHANGE** = 0x06  
battery status changed

**ESP\_AVRC\_RN\_SYSTEM\_STATUS\_CHANGE** = 0x07  
system status changed

**ESP\_AVRC\_RN\_APP\_SETTING\_CHANGE** = 0x08  
application settings changed

**ESP\_AVRC\_RN\_NOW\_PLAYING\_CHANGE** = 0x09  
now playing content changed

**ESP\_AVRC\_RN\_AVAILABLE\_PLAYERS\_CHANGE** = 0x0a  
available players changed

**ESP\_AVRC\_RN\_ADDRESSED\_PLAYER\_CHANGE** = 0x0b  
the addressed player changed

**ESP\_AVRC\_RN\_UIDS\_CHANGE** = 0x0c  
UIDs changed

**ESP\_AVRC\_RN\_VOLUME\_CHANGE** = 0x0d  
volume changed locally on TG

**ESP\_AVRC\_RN\_MAX\_EVT**

**enum esp\_avrc\_rn\_evt\_cap\_t**  
AVRC target notification event notification capability.

*Values:*

**ESP\_AVRC\_RN\_CAP\_ALLOWED\_EVT** = 0  
all of the notification events that can possibly be supported, immutable

**ESP\_AVRC\_RN\_CAP\_SUPPORTED\_EVT** = 1  
notification events selectively supported according to the current configuration

**ESP\_AVRC\_RN\_CAP\_MAX**

**enum esp\_avrc\_rn\_rsp\_t**  
AVRC notification response type.

*Values:*

**ESP\_AVRC\_RN\_RSP\_INTERIM** = 13  
initial response to RegisterNotification, should be sent T\_mtp(1000ms) from receiving the command

**ESP\_AVRC\_RN\_RSP\_CHANGED** = 15  
final response to RegisterNotification command

**enum esp\_avrc\_ps\_attr\_ids\_t**  
AVRC player setting ids.

*Values:*

**ESP\_AVRC\_PS\_EQUALIZER** = 0x01  
equalizer, on or off

**ESP\_AVRC\_PS\_REPEAT\_MODE** = 0x02  
repeat mode

**ESP\_AVRC\_PS\_SHUFFLE\_MODE** = 0x03  
shuffle mode

**ESP\_AVRC\_PS\_SCAN\_MODE** = 0x04  
scan mode on or off

**ESP\_AVRC\_PS\_MAX\_ATTR**

**enum esp\_avrc\_ps\_eq\_value\_ids\_t**

AVRC equalizer modes.

*Values:***ESP\_AVRC\_PS\_EQUALIZER\_OFF** = 0x1  
equalizer OFF**ESP\_AVRC\_PS\_EQUALIZER\_ON** = 0x2  
equalizer ON**enum esp\_avrc\_ps\_rpt\_value\_ids\_t**

AVRC repeat modes.

*Values:***ESP\_AVRC\_PS\_REPEAT\_OFF** = 0x1  
repeat mode off**ESP\_AVRC\_PS\_REPEAT\_SINGLE** = 0x2  
single track repeat**ESP\_AVRC\_PS\_REPEAT\_GROUP** = 0x3  
group repeat**enum esp\_avrc\_ps\_shf\_value\_ids\_t**

AVRC shuffle modes.

*Values:***ESP\_AVRC\_PS\_SHUFFLE\_OFF** = 0x1**ESP\_AVRC\_PS\_SHUFFLE\_ALL** = 0x2**ESP\_AVRC\_PS\_SHUFFLE\_GROUP** = 0x3**enum esp\_avrc\_ps\_scn\_value\_ids\_t**

AVRC scan modes.

*Values:***ESP\_AVRC\_PS\_SCAN\_OFF** = 0x1  
scan off**ESP\_AVRC\_PS\_SCAN\_ALL** = 0x2  
all tracks scan**ESP\_AVRC\_PS\_SCAN\_GROUP** = 0x3  
group scan**enum esp\_avrc\_rsp\_t**

AVCTP response codes.

*Values:***ESP\_AVRC\_RSP\_NOT\_IMPL** = 8  
not implemented**ESP\_AVRC\_RSP\_ACCEPT** = 9  
accept**ESP\_AVRC\_RSP\_REJECT** = 10  
reject**ESP\_AVRC\_RSP\_IN\_TRANS** = 11  
in transition**ESP\_AVRC\_RSP\_IMPL\_STBL** = 12  
implemented/stable

**ESP\_AVRC\_RSP\_CHANGED** = 13  
changed

**ESP\_AVRC\_RSP\_INTERIM** = 15  
interim

**enum esp\_avrc\_batt\_stat\_t**  
AVRCP battery status.

*Values:*

**ESP\_AVRC\_BATT\_NORMAL** = 0  
normal state

**ESP\_AVRC\_BATT\_WARNING** = 1  
unable to operate soon

**ESP\_AVRC\_BATT\_CRITICAL** = 2  
cannot operate any more

**ESP\_AVRC\_BATT\_EXTERNAL** = 3  
plugged to external power supply

**ESP\_AVRC\_BATT\_FULL\_CHARGE** = 4  
when completely charged from external power supply

**enum esp\_avrc\_playback\_stat\_t**  
AVRCP current status of playback.

*Values:*

**ESP\_AVRC\_PLAYBACK\_STOPPED** = 0  
stopped

**ESP\_AVRC\_PLAYBACK\_PLAYING** = 1  
playing

**ESP\_AVRC\_PLAYBACK\_PAUSED** = 2  
paused

**ESP\_AVRC\_PLAYBACK\_FWD\_SEEK** = 3  
forward seek

**ESP\_AVRC\_PLAYBACK\_REV\_SEEK** = 4  
reverse seek

**ESP\_AVRC\_PLAYBACK\_ERROR** = 0xFF  
error

## SPP API

### Overview [Instructions](#)

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data `bluetooth/bluedroid/classic_bt/bt_spp_acceptor`, `bluetooth/bluedroid/classic_bt/bt_spp_initiator`

### API Reference

#### Header File

- `bt/host/bluedroid/api/include/api/esp_spp_api.h`

## Functions

*esp\_err\_t* **esp\_spp\_register\_callback** (*esp\_spp\_cb\_t* callback)

This function is called to init callbacks with SPP module.

### Return

- ESP\_OK: success
- other: failed

### Parameters

- [in] callback: pointer to the init callback function.

*esp\_err\_t* **esp\_spp\_init** (*esp\_spp\_mode\_t* mode)

This function is called to init SPP.

### Return

- ESP\_OK: success
- other: failed

### Parameters

- [in] mode: Choose the mode of SPP, ESP\_SPP\_MODE\_CB or ESP\_SPP\_MODE\_VFS.

*esp\_err\_t* **esp\_spp\_deinit** (void)

This function is called to uninit SPP.

### Return

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_start\_discovery** (*esp\_bd\_addr\_t* bd\_addr)

This function is called to performs service discovery for the services provided by the given peer device. When the operation is complete the callback function will be called with a ESP\_SPP\_DISCOVERY\_COMP\_EVT.

### Return

- ESP\_OK: success
- other: failed

### Parameters

- [in] bd\_addr: Remote device bluetooth device address.

*esp\_err\_t* **esp\_spp\_connect** (*esp\_spp\_sec\_t* sec\_mask, *esp\_spp\_role\_t* role, *uint8\_t* remote\_scn, *esp\_bd\_addr\_t* peer\_bd\_addr)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP\_SPP\_CL\_INIT\_EVT. When the connection is established or failed, the callback is called with ESP\_SPP\_OPEN\_EVT.

### Return

- ESP\_OK: success
- other: failed

### Parameters

- [in] sec\_mask: Security Setting Mask. Suggest to use ESP\_SPP\_SEC\_NONE, ESP\_SPP\_SEC\_AUTHORIZE or ESP\_SPP\_SEC\_AUTHENTICATE only.
- [in] role: Master or slave.
- [in] remote\_scn: Remote device bluetooth device SCN.
- [in] peer\_bd\_addr: Remote device bluetooth device address.

*esp\_err\_t* **esp\_spp\_disconnect** (*uint32\_t* handle)

This function closes an SPP connection.

### Return

- ESP\_OK: success
- other: failed

### Parameters

- [in] handle: The connection handle.

*esp\_err\_t* **esp\_spp\_start\_srv** (*esp\_spp\_sec\_t* sec\_mask, *esp\_spp\_role\_t* role, *uint8\_t* local\_scn, *const* *char* \*name)

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth

device. When the server is started successfully, the callback is called with `ESP_SPP_START_EVT`. When the connection is established, the callback is called with `ESP_SPP_SRV_OPEN_EVT`.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- `[in] sec_mask`: Security Setting Mask. Suggest to use `ESP_SPP_SEC_NONE`, `ESP_SPP_SEC_AUTHORIZE` or `ESP_SPP_SEC_AUTHENTICATE` only.
- `[in] role`: Master or slave.
- `[in] local_scn`: The specific channel you want to get. If channel is 0, means get any channel.
- `[in] name`: Server's name.

***esp\_err\_t* esp\_spp\_stop\_srv** (void)

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with `ESP_SPP_CLOSE_EVT`, and the number of `ESP_SPP_CLOSE_EVT` is equal to the number of connection. When the operation is completed, the callback is called with `ESP_SPP_SRV_STOP_EVT`. This function must be called after `esp_spp_init()` successful and before `esp_spp_deinit()`.

**Return**

- `ESP_OK`: success
- other: failed

***esp\_err\_t* esp\_spp\_stop\_srv\_scn** (uint8\_t scn)

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with `ESP_SPP_CLOSE_EVT`, and the number of `ESP_SPP_CLOSE_EVT` is equal to the number of connection. When the operation is completed, the callback is called with `ESP_SPP_SRV_STOP_EVT`. This function must be called after `esp_spp_init()` successful and before `esp_spp_deinit()`.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- `[in] scn`: Server channel number.

***esp\_err\_t* esp\_spp\_write** (uint32\_t handle, int len, uint8\_t \*p\_data)

This function is used to write data, only for `ESP_SPP_MODE_CB`.

**Return**

- `ESP_OK`: success
- other: failed

**Parameters**

- `[in] handle`: The connection handle.
- `[in] len`: The length of the data written.
- `[in] p_data`: The data written.

***esp\_err\_t* esp\_spp\_vfs\_register** (void)

This function is used to register VFS.

**Return**

- `ESP_OK`: success
- other: failed

invalid characters in dial string

**ESP\_HF\_CME\_NO\_NETWORK\_SERVICE** = 30  
no network service

**ESP\_HF\_CME\_NETWORK\_TIMEOUT** = 31  
network timeout

**ESP\_HF\_CME\_NETWORK\_NOT\_ALLOWED** = 32  
network not allowed emergency calls only

## HFP CLIENT API

**Overview** [Instructions](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_hf\\_client\\_api.h](#)

## Functions

*esp\_err\_t* **esp\_hf\_client\_register\_callback** (*esp\_hf\_client\_cb\_t* callback)

Register application callback function to HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by HFP client.

### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

### Parameters

- [in] callback: HFP client event callback function

*esp\_err\_t* **esp\_hf\_client\_init** (void)

Initialize the bluetooth HFP client module. This function should be called after `esp_bluedroid_enable()` completes successfully.

### Return

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_deinit** (void)

De-initialize for HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth HFP audio gateway(AG) device, must after `esp_hf_client_init()`

### Return

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

### Parameters

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_hf\_client\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote HFP audio gateway.

### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

### Parameters

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_hf\_client\_connect\_audio** (*esp\_bd\_addr\_t* remote\_bda)

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

### Parameters

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_hf\_client\_disconnect\_audio** (*esp\_bd\_addr\_t* remote\_bda)

Release the established audio connection with remote HFP AG.

### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_hf\_client\_start\_voice\_recognition** (void)

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_stop\_voice\_recognition** (void)

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_volume\_update** (*esp\_hf\_volume\_control\_target\_t* type, int volume)

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

*esp\_err\_t* **esp\_hf\_client\_dial** (const char \*number)

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] number: number string of the call. If NULL, the last number is called(aka re-dial)

*esp\_err\_t* **esp\_hf\_client\_dial\_memory** (int location)

Place a call with number specified by location(speed dial). As a precondition, to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] location: location of the number in the memory

*esp\_err\_t* **esp\_hf\_client\_send\_chld\_cmd** (*esp\_hf\_chld\_type\_t* chld, int idx)

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer

- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] chld: AT+CHLD call hold and multiparty handling AT command.
- [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP\_HF\_CHLD\_TYPE\_REL\_X or ESP\_HF\_CHLD\_TYPE\_PRIV\_X

*esp\_err\_t* **esp\_hf\_client\_send\_btrh\_cmd** (*esp\_hf\_btrh\_cmd\_t* btrh)

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] btrh: response and hold action to send

*esp\_err\_t* **esp\_hf\_client\_answer\_call** (void)

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_reject\_call** (void)

Reject an incoming call(send AT+CHUP command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_query\_current\_calls** (void)

Query list of current calls in AG(send AT+CLCC command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_query\_current\_operator\_name** (void)

Query the name of currently selected network operator in AG(use AT+COPS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_retrieve\_subscriber\_info** (void)

Get subscriber information number from AG(send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**esp\_err\_t esp\_hf\_client\_send\_dtmf** (char *code*)

Transmit DTMF codes during an ongoing call (use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *code*: dtmf code, single ascii character in the set 0-9, #, \*, A-D

**esp\_err\_t esp\_hf\_client\_request\_last\_voice\_tag\_number** (void)

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**esp\_err\_t esp\_hf\_client\_send\_nrec** (void)

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: NREC=0 request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**esp\_err\_t esp\_hf\_client\_register\_data\_callback** (*esp\_hf\_client\_incoming\_data\_cb\_t* *recv*, *esp\_hf\_client\_outgoing\_data\_cb\_t* *send*)

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

**Parameters**

- [in] *recv*: HFP client incoming data callback function
- [in] *send*: HFP client outgoing data callback function

void **esp\_hf\_client\_outgoing\_data\_ready** (void)

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke *esp\_hf\_client\_outgoing\_data\_cb\_t* to fetch data.

void **esp\_hf\_client\_pcm\_resample\_init** (uint32\_t *src\_sps*, uint32\_t *bits*, uint32\_t *channels*)

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**

- [in] *src\_sps*: original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- [in] *bits*: number of bits per pcm sample (16)
- [in] *channels*: number of channels (i.e. mono(1), stereo(2)...) )

void **esp\_hf\_client\_pcm\_resample\_deinit** (void)

Deinitialize the down sampling converter.

int32\_t **esp\_hf\_client\_pcm\_resample** (void \**src*, uint32\_t *in\_bytes*, void \**dst*)

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

**Return** number of samples converted

**Parameters**

- [in] src: pointer to the buffer where the original sampling PCM are stored
- [in] in\_bytes: length of the input PCM sample buffer in byte
- [in] dst: pointer to the buffer which is to be used to store the converted PCM samples

## Unions

### union esp\_hf\_client\_cb\_param\_t

#include <esp\_hf\_client\_api.h> HFP client callback parameters.

### Type Definitions

**typedef** void (\***esp\_hf\_client\_incoming\_data\_cb\_t**) (const uint8\_t \*buf, uint32\_t len)  
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

#### Parameters

- [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] len: : size(in bytes) in buf

**typedef** uint32\_t (\***esp\_hf\_client\_outgoing\_data\_cb\_t**) (uint8\_t \*buf, uint32\_t len)  
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Return** length of data successfully read

#### Parameters

- [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] len: : size(in bytes) in buf

**typedef** void (\***esp\_hf\_client\_cb\_t**) (*esp\_hf\_client\_cb\_event\_t* event, *esp\_hf\_client\_cb\_param\_t* \*param)

HFP client callback function type.

#### Parameters

- event: : Event type
- param: : Pointer to callback parameter

### Enumerations

**enum** **esp\_hf\_client\_connection\_state\_t**  
Bluetooth HFP RFCOMM connection and service level connection status.

*Values:*

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_DISCONNECTED** = 0  
RFCOMM data link channel released

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_CONNECTING**  
connecting remote device on the RFCOMM data link

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_CONNECTED**  
RFCOMM connection established

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_SLC\_CONNECTED**  
service level connection established

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_DISCONNECTING**  
disconnecting with remote device on the RFCOMM dat link

**enum** **esp\_hf\_client\_audio\_state\_t**  
Bluetooth HFP audio connection status.

*Values:*

**ESP\_HF\_CLIENT\_AUDIO\_STATE\_DISCONNECTED** = 0  
audio connection released

**ESP\_HF\_CLIENT\_AUDIO\_STATE\_CONNECTING**  
audio connection has been initiated

**ESP\_HF\_CLIENT\_AUDIO\_STATE\_CONNECTED**  
audio connection is established

**ESP\_HF\_CLIENT\_AUDIO\_STATE\_CONNECTED\_MSBC**  
mSBC audio connection is established

**enum esp\_hf\_client\_in\_band\_ring\_state\_t**  
in-band ring tone state

*Values:*

**ESP\_HF\_CLIENT\_IN\_BAND\_RINGTONE\_NOT\_PROVIDED = 0**

**ESP\_HF\_CLIENT\_IN\_BAND\_RINGTONE\_PROVIDED**

**enum esp\_hf\_client\_cb\_event\_t**  
HF CLIENT callback events.

*Values:*

**ESP\_HF\_CLIENT\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event

**ESP\_HF\_CLIENT\_AUDIO\_STATE\_EVT**  
audio connection state change event

**ESP\_HF\_CLIENT\_BVRA\_EVT**  
voice recognition state change event

**ESP\_HF\_CLIENT\_CIND\_CALL\_EVT**  
call indication

**ESP\_HF\_CLIENT\_CIND\_CALL\_SETUP\_EVT**  
call setup indication

**ESP\_HF\_CLIENT\_CIND\_CALL\_HELD\_EVT**  
call held indication

**ESP\_HF\_CLIENT\_CIND\_SERVICE\_AVAILABILITY\_EVT**  
network service availability indication

**ESP\_HF\_CLIENT\_CIND\_SIGNAL\_STRENGTH\_EVT**  
signal strength indication

**ESP\_HF\_CLIENT\_CIND\_ROAMING\_STATUS\_EVT**  
roaming status indication

**ESP\_HF\_CLIENT\_CIND\_BATTERY\_LEVEL\_EVT**  
battery level indication

**ESP\_HF\_CLIENT\_COPS\_CURRENT\_OPERATOR\_EVT**  
current operator information

**ESP\_HF\_CLIENT\_BTRH\_EVT**  
call response and hold event

**ESP\_HF\_CLIENT\_CLIP\_EVT**  
Calling Line Identification notification

**ESP\_HF\_CLIENT\_CCWA\_EVT**  
call waiting notification

**ESP\_HF\_CLIENT\_CLCC\_EVT**  
list of current calls notification

**ESP\_HF\_CLIENT\_VOLUME\_CONTROL\_EVT**  
audio volume control command from AG, provided by +VGM or +VGS message

**ESP\_HF\_CLIENT\_AT\_RESPONSE\_EVT**

AT command response event

**ESP\_HF\_CLIENT\_CNUM\_EVT**

subscriber information response from AG

**ESP\_HF\_CLIENT\_BSIR\_EVT**

setting of in-band ring tone

**ESP\_HF\_CLIENT\_BINP\_EVT**

requested number of last voice tag from AG

**ESP\_HF\_CLIENT\_RING\_IND\_EVT**

ring indication event

## HFP AG API

[Overview](#) [Instructions](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_hf\\_ag\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_bt\_hf\_register\_callback** (*esp\_hf\_cb\_t* callback)

Register application callback function to HFP AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by HFP AG.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

**Parameters**

- [in] callback: HFP AG event callback function

*esp\_err\_t* **esp\_bt\_hf\_init** (*esp\_bd\_addr\_t* remote\_addr)

Initialize the bluetooth HF AG module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_deinit** (*esp\_bd\_addr\_t* remote\_addr)

De-initialize for HF AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth HFP client device, must after `esp_bt_hf_init()`

**Return**

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth HFP client device address

*esp\_err\_t* **esp\_bt\_hf\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_connect\_audio** (*esp\_bd\_addr\_t* remote\_bda)

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist between HF client and AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_disconnect\_audio** (*esp\_bd\_addr\_t* remote\_bda)

Release the established audio connection with remote HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_vra** (*esp\_bd\_addr\_t* remote\_bda, *esp\_hf\_vr\_state\_t* value)

Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: the device address of voice recognition initiator
- [in] value: 0 - voice recognition disabled, 1- voice recognition enabled

*esp\_err\_t* **esp\_bt\_hf\_volume\_control** (*esp\_bd\_addr\_t* remote\_bda, *esp\_hf\_volume\_control\_target\_t* type, int volume)

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

*esp\_err\_t esp\_hf\_unat\_response* (*esp\_bd\_addr\_t remote\_addr*, char \**unat*)

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *remote\_addr*: remote bluetooth device address
- [in] *unat*: User AT command response to HF Client. It will response “ERROR” by default if *unat* is NULL.

*esp\_err\_t esp\_bt\_hf\_cme\_response* (*esp\_bd\_addr\_t remote\_bda*, *esp\_hf\_at\_response\_code\_t response\_code*, *esp\_hf\_cme\_err\_t error\_code*)

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *remote\_bda*: remote bluetooth device address
- [in] *response\_code*: AT command response code
- [in] *error\_code*: CME error code

*esp\_err\_t esp\_bt\_hf\_indchange\_notification* (*esp\_bd\_addr\_t remote\_addr*,  
*esp\_hf\_call\_status\_t call\_state*,  
*esp\_hf\_call\_setup\_status\_t call\_setup\_state*,  
*esp\_hf\_network\_state\_t ntk\_state*, int *signal*)

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *remote\_addr*: remote bluetooth device address
- [in] *call\_state*: call state
- [in] *call\_setup\_state*: call setup state
- [in] *ntk\_state*: network service state
- [in] *signal*: signal strength from 0 to 5

*esp\_err\_t esp\_bt\_hf\_cind\_response* (*esp\_bd\_addr\_t remote\_addr*, *esp\_hf\_call\_status\_t call\_state*, *esp\_hf\_call\_setup\_status\_t call\_setup\_state*,  
*esp\_hf\_network\_state\_t ntk\_state*, int *signal*,  
*esp\_hf\_roaming\_status\_t roam*, int *batt\_lev*,  
*esp\_hf\_call\_held\_status\_t call\_held\_status*)

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *remote\_addr*: remote bluetooth device address
- [in] *call\_state*: call state
- [in] *call\_setup\_state*: call setup state
- [in] *ntk\_state*: network service state

- [in] signal: signal strength from 0 to 5
- [in] roam: roam state
- [in] batt\_lev: battery level from 0 to 5
- [in] call\_held\_status: call held status

*esp\_err\_t* **esp\_bt\_hf\_cops\_response** (*esp\_bd\_addr\_t* remote\_addr, char \*name)

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] name: current operator name

*esp\_err\_t* **esp\_bt\_hf\_clcc\_response** (*esp\_bd\_addr\_t* remote\_addr, int index, *esp\_hf\_current\_call\_direction\_t* dir, *esp\_hf\_current\_call\_status\_t* current\_call\_state, *esp\_hf\_current\_call\_mode\_t* mode, *esp\_hf\_current\_call\_mpty\_type\_t* mpty, char \*number, *esp\_hf\_call\_addr\_type\_t* type)

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] index: the index of current call
- [in] dir: call direction (incoming/outgoing)
- [in] current\_call\_state: current call state
- [in] mode: current call mode (voice/data/fax)
- [in] mpty: single or multi type
- [in] number: current call number
- [in] type: international type or unknow

*esp\_err\_t* **esp\_bt\_hf\_cnum\_response** (*esp\_bd\_addr\_t* remote\_addr, char \*number, *esp\_hf\_subscriber\_service\_type\_t* type)

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] number: registration number
- [in] type: service type (unknown/voice/fax)

*esp\_err\_t* **esp\_bt\_hf\_bsir** (*esp\_bd\_addr\_t* remote\_addr, *esp\_hf\_in\_band\_ring\_state\_t* state)

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] state: in-band ring tone state

*esp\_err\_t esp\_bt\_hf\_answer\_call* (*esp\_bd\_addr\_t remote\_addr*, int *num\_active*, int *num\_held*, *esp\_hf\_call\_status\_t call\_state*, *esp\_hf\_call\_setup\_status\_t call\_setup\_state*, char \**number*, *esp\_hf\_call\_addr\_type\_t call\_addr\_type*)

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the incoming call
- [in] call\_addr\_type: call address type

*esp\_err\_t esp\_bt\_hf\_reject\_call* (*esp\_bd\_addr\_t remote\_addr*, int *num\_active*, int *num\_held*, *esp\_hf\_call\_status\_t call\_state*, *esp\_hf\_call\_setup\_status\_t call\_setup\_state*, char \**number*, *esp\_hf\_call\_addr\_type\_t call\_addr\_type*)

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the incoming call
- [in] call\_addr\_type: call address type

*esp\_err\_t esp\_bt\_hf\_out\_call* (*esp\_bd\_addr\_t remote\_addr*, int *num\_active*, int *num\_held*, *esp\_hf\_call\_status\_t call\_state*, *esp\_hf\_call\_setup\_status\_t call\_setup\_state*, char \**number*, *esp\_hf\_call\_addr\_type\_t call\_addr\_type*)

Reject incoming call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the outgoing call

- [in] `call_addr_type`: call address type

```
esp_err_t esp_bt_hf_end_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                             esp_hf_call_status_t call_state, esp_hf_call_setup_status_t
                             call_setup_state, char *number, esp_hf_call_addr_type_t
                             call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with AG.

#### Return

- `ESP_OK`: disconnect request is sent to lower layer
- `ESP_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

#### Parameters

- [in] `remote_addr`: remote bluetooth device address
- [in] `num_active`: the number of active call
- [in] `num_held`: the number of held call
- [in] `call_state`: call state
- [in] `call_setup_state`: call setup state
- [in] `number`: number of the call
- [in] `call_addr_type`: call address type

```
esp_err_t esp_bt_hf_register_data_callback (esp_hf_incoming_data_cb_t recv,
                                             esp_hf_outgoing_data_cb_t send)
```

Register AG data output function; the callback is only used in the case that Voice Over HCI is enabled.

#### Return

- `ESP_OK`: success
- `ESP_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: if callback is a NULL function pointer

#### Parameters

- [in] `recv`: HFP client incoming data callback function
- [in] `send`: HFP client outgoing data callback function

```
void esp_hf_outgoing_data_ready (void)
```

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke `esp_hf_client_outgoing_data_cb_t` to fetch data.

## Unions

```
union esp_hf_cb_param_t

**ESP\_HF\_CHLD\_FEAT\_MERGE\_DETACH**

### Type Definitions

```
typedef void (*esp_hf_incoming_data_cb_t) (const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.
```

### Parameters

- [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] len: : size(in bytes) in buf

**typedef** uint32\_t(\*esp\_hf\_outgoing\_data\_cb\_t)(uint8\_t \*buf, uint32\_t len)

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Return** length of data successfully read

**Parameters**

- [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] len: : size(in bytes) in buf

**typedef** void(\*esp\_hf\_cb\_t)(esp\_hf\_cb\_event\_t event, esp\_hf\_cb\_param\_t \*param)

HF AG callback function type.

**Parameters**

- event: : Event type
- param: : Pointer to callback parameter

### Enumerations

**enum** esp\_hf\_cb\_event\_t

HF callback events.

*Values:*

**ESP\_HF\_CONNECTION\_STATE\_EVT** = 0

Connection state changed event

**ESP\_HF\_AUDIO\_STATE\_EVT**

Audio connection state change event

**ESP\_HF\_BVRA\_RESPONSE\_EVT**

Voice recognition state change event

**ESP\_HF\_VOLUME\_CONTROL\_EVT**

Audio volume control command from HF Client, provided by +VGM or +VGS message

**ESP\_HF\_UNAT\_RESPONSE\_EVT**

Unknown AT cmd Response

**ESP\_HF\_IND\_UPDATE\_EVT**

Indicator Update Event

**ESP\_HF\_CIND\_RESPONSE\_EVT**

Call And Device Indicator Response

**ESP\_HF\_COPS\_RESPONSE\_EVT**

Current operator information

**ESP\_HF\_CLCC\_RESPONSE\_EVT**

List of current calls notification

**ESP\_HF\_CNUM\_RESPONSE\_EVT**

Subscriber information response from HF Client

**ESP\_HF\_VTS\_RESPONSE\_EVT**

Enable or not DTMF

**ESP\_HF\_NREC\_RESPONSE\_EVT**

Enable or not NREC

**ESP\_HF\_ATA\_RESPONSE\_EVT**

Answer an Incoming Call

**ESP\_HF\_CHUP\_RESPONSE\_EVT**

Reject an Incoming Call

**ESP\_HF\_DIAL\_EVT**

Origin an outgoing call with specific number or the dial the last number

**ESP\_HF\_WBS\_RESPONSE\_EVT**

Codec Status

**ESP\_HF\_BCS\_RESPONSE\_EVT**

Final Codec Choice

## 2.1.5 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

### Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

## API Reference

### Header File

- `bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

### Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

#### Return

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init` (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

**Return**

- ESP\_OK if the initialization is successful
- Appropriate error code from esp\_err\_t in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

**Return**

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from esp\_err\_t in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_and\_controller\_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
↳error: %d", ret);
    }
}
```

If nimble\_port\_freertos\_init() is used during initialization, then nimble\_port\_freertos\_deinit() should be called in the host task after nimble\_port\_run().

**Return**

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from esp\_err\_t in case of an error

**Macros**

**BLE\_HCI\_UART\_H4\_NONE**

**BLE\_HCI\_UART\_H4\_CMD**

**BLE\_HCI\_UART\_H4\_ACL**

**BLE\_HCI\_UART\_H4\_SCO**

**BLE\_HCI\_UART\_H4\_EVT**

**2.1.6 ESP-BLE-MESH**

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [Getting Started with ESP-BLE-MESH](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH Architecture](#).

## Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH Examples](#) and [ESP-BLE-MESH Demo Videos](#).

## API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

## ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

## Header File

- [bt/esp\\_ble\\_mesh/api/esp\\_ble\\_mesh\\_defs.h](#)

## Unions

```
union esp_ble_mesh_prov_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

## Public Members

```

    Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

```

**int err\_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

**struct** *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]* **provisioner\_enable\_heartbeat\_rcv\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT

uint8\_t **type**

Type of the filter used for receiving heartbeat messages

**struct** *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]* **provisioner\_set\_heartbeat\_filter\_type\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT

uint8\_t **op**

Operation (add, remove, clean)

uint16\_t **hb\_src**

Heartbeat source address

uint16\_t **hb\_dst**

Heartbeat destination address

**struct** *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]* **provisioner\_set\_heartbeat\_filter\_info\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT

uint8\_t **init\_ttl**

Heartbeat InitTTL

uint8\_t **rx\_ttl**

Heartbeat RxTTL

uint8\_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16\_t **feature**

Bit field of currently active features of the node

int8\_t **rss\_i**

RSSI of the heartbeat message

**struct** *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]* **provisioner\_rcv\_heartbeat**  
ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT.

### Public Types

**enum** **[anonymous]**  
This enum value is the reason of friendship termination on the friend node side

*Values:*

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_ESTABLISH\_FAIL**  
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_POLL\_TIMEOUT**  
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_REQ**  
Receive Friend Request from existing Low Power Node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_CLEAR**  
Receive Friend Clear from other friend node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_DISABLE**  
Friend feature disabled or corresponding NetKey is deleted

### Public Members

**uint16\_t lpn\_addr**

Low Power Node unicast address

*esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::[anonymous] reason*

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

**struct ble\_mesh\_heartbeat\_msg\_rcv\_param**

Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT

**struct** *esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_mod\_rcv\_publish\_msg\_param* **client\_rcv\_publish\_msg**  
Event parameter of ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT

**struct** *esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_client\_model\_send\_timeout\_param* **client\_send\_timeout**  
Event parameter of ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT

**struct** *esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_model\_publish\_update\_evt\_param* **model\_publish\_update**  
Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT

**struct** *esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_server\_model\_update\_state\_comp\_param* **server\_model\_update**  
Event parameter of ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT

**struct** **ble\_mesh\_client\_model\_send\_timeout\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT.

**Public Members**

**uint32\_t opcode**  
Opcode of the previously sent message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which sends the previous message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**  
Pointer to the context of the previous message

**struct** **ble\_mesh\_mod\_rcv\_publish\_msg\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT.

**Public Members**

**uint32\_t opcode**  
Opcode of the unsolicited received message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**  
Pointer to the context of the message

**uint16\_t length**  
Length of the received message

**uint8\_t \*msg**  
Value of the received message

**struct** **ble\_mesh\_model\_operation\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT.

**Public Members**

`uint32_t opcode`  
Opcode of the received message

`esp_ble_mesh_model_t *model`  
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`  
Pointer to the context of the received message

`uint16_t length`  
Length of the received message

`uint8_t *msg`  
Value of the received message

**struct ble\_mesh\_model\_publish\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT.

**Public Members**

`int err_code`  
Indicate the result of publishing a message

`esp_ble_mesh_model_t *model`  
Pointer to the model which publishes the message

**struct ble\_mesh\_model\_publish\_update\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT.

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the model which is going to update its publish message

**struct ble\_mesh\_model\_send\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT.

**Public Members**

`int err_code`  
Indicate the result of sending a message

`uint32_t opcode`  
Opcode of the message

`esp_ble_mesh_model_t *model`  
Pointer to the model which sends the message

`esp_ble_mesh_msg_ctx_t *ctx`  
Context of the message

**struct ble\_mesh\_server\_model\_update\_state\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT.

### Public Members

int **err\_code**  
Indicate the result of updating server model state

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the server model which state value is updated

*esp\_ble\_mesh\_server\_state\_type\_t* **type**  
Type of the updated server state

### Structures

**struct esp\_ble\_mesh\_deinit\_param\_t**  
BLE Mesh deinit parameters

### Public Members

bool **erase\_flash**  
Indicate if erasing flash when deinit mesh stack

**struct esp\_ble\_mesh\_elem\_t**  
Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

### Public Members

uint16\_t **element\_addr**  
Element Address, assigned during provisioning.

const uint16\_t **location**  
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8\_t **sig\_model\_count**  
SIG Model count

const uint8\_t **vnd\_model\_count**  
Vendor Model count

*esp\_ble\_mesh\_model\_t* \***sig\_models**  
SIG Models

*esp\_ble\_mesh\_model\_t* \***vnd\_models**  
Vendor Models

**struct esp\_ble\_mesh\_model\_pub\_t**  
Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model to which the context belongs. Initialized by the stack.

uint16\_t **publish\_addr**  
Publish Address.

uint16\_t **app\_idx** : 12  
Publish AppKey Index.

uint16\_t **cred** : 1  
Friendship Credentials Flag.

`uint16_t send_rel` : 1  
Force reliable sending (segment acks)

`uint8_t ttl`  
Publish Time to Live.

`uint8_t retransmit`  
Retransmit Count & Interval Steps.

`uint8_t period`  
Publish Period.

`uint8_t period_div` : 4  
Divisor for the Period.

`uint8_t fast_period` : 1  
Use FastPeriodDivisor

`uint8_t count` : 3  
Retransmissions left.

`uint32_t period_start`  
Start of the current period.

**struct** `net_buf_simple *msg`  
Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

*`esp_ble_mesh_cb_t update`*  
Callback used to update publish message. Initialized by the stack.

**struct** `k_delayed_work timer`  
Publish Period Timer. Initialized by the stack.

`uint8_t dev_role`  
Role of the device that is going to publish messages

**struct** `esp_ble_mesh_model_op_t`  
Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

### Public Members

**const** `uint32_t opcode`  
Message opcode

**const** `size_t min_len`  
Message minimum length

*`esp_ble_mesh_cb_t param_cb`*  
Callback used to handle message. Initialized by the stack.

**struct** `esp_ble_mesh_model_cbs_t`  
Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

### Public Members

*`esp_ble_mesh_cb_t init_cb`*  
Callback used during model initialization. Initialized by the stack.

**struct esp\_ble\_mesh\_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`

**Public Members**

`union esp_ble_mesh_model::[anonymous] [anonymous]`

Model ID

`uint8_t element_idx`

Internal information, mainly for persistent storage Belongs to Nth element

`uint8_t model_idx`

Is the Nth model in the element

`uint16_t flags`

Information about what has changed

`esp_ble_mesh_elem_t *element`

The Element to which this Model belongs

`esp_ble_mesh_model_pub_t *const pub`

Model Publication

`uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]`

AppKey List

`uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]`

Subscription List (group or virtual addresses)

`esp_ble_mesh_model_op_t *op`

Model operation context

`esp_ble_mesh_model_cbs_t *cb`

Model callback structure

`void *user_data`

Model-specific user data

**struct esp\_ble\_mesh\_msg\_ctx\_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`

**Public Members**

`uint16_t net_idx`

NetKey Index of the subnet through which to send the message.

`uint16_t app_idx`

AppKey Index for message encryption.

`uint16_t addr`

Remote address.

`uint16_t recv_dst`

Destination address of a received message. Not used for sending.

`int8_t recv_rssi`

RSSI of received packet. Not used for sending.

`uint8_t recv_ttl : 7`

Received TTL value. Not used for sending.

`uint8_t send_rel : 1`

Force sending reliably by using segment acknowledgement

`uint8_t send_ttl`  
TTL, or `ESP_BLE_MESH_TTL_DEFAULT` for default TTL.

`uint32_t recv_op`  
Opcode of a received message. Not used for sending message.

`esp_ble_mesh_model_t *model`  
Model corresponding to the message, no need to be initialized before sending message

`bool srv_send`  
Indicate if the message is sent by a node server model, no need to be initialized before sending message

**struct esp\_ble\_mesh\_prov\_t**  
Provisioning properties & capabilities. This structure is associated with struct `bt_mesh_prov` in `mesh_access.h`

**struct esp\_ble\_mesh\_comp\_t**  
Node Composition data context. This structure is associated with struct `bt_mesh_comp` in `mesh_access.h`

### Public Members

`uint16_t cid`  
16-bit SIG-assigned company identifier

`uint16_t pid`  
16-bit vendor-assigned product identifier

`uint16_t vid`  
16-bit vendor-assigned product version identifier

`size_t element_count`  
Element count

`esp_ble_mesh_elem_t *elements`  
A sequence of elements

**struct esp\_ble\_mesh\_unprov\_dev\_add\_t**  
Information of the device which is going to be added for provisioning.

### Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

`esp_ble_mesh_addr_type_t addr_type`  
Device address type

`uint8_t uuid[16]`  
Device UUID

`uint16_t oob_info`  
Device OOB Info `ADD_DEV_START_PROV_NOW_FLAG` shall not be set if the bearer has both `PB-ADV` and `PB-GATT` enabled

`esp_ble_mesh_prov_bearer_t bearer`  
Provisioning Bearer

**struct esp\_ble\_mesh\_device\_delete\_t**  
Information of the device which is going to be deleted.

### Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint8\_t **flag**

BIT0: device address; BIT1: device UUID

**struct esp\_ble\_mesh\_prov\_data\_info\_t**

Information of the provisioner which is going to be updated.

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **flags**

Flags

uint32\_t **iv\_index**

IV Index

uint8\_t **flag**

BIT0: net\_idx; BIT1: flags; BIT2: iv\_index

**struct esp\_ble\_mesh\_node\_t**

Information of the provisioned node

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Node device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Node device address type

uint8\_t **dev\_uuid**[16]

Device UUID

uint16\_t **oob\_info**

Node OOB information

uint16\_t **unicast\_addr**

Node unicast address

uint8\_t **element\_num**

Node element number

uint16\_t **net\_idx**

Node NetKey Index

uint8\_t **flags**

Node key refresh flag and iv update flag

uint32\_t **iv\_index**

Node IV Index

uint8\_t **dev\_key**[16]

Node device key

char **name**[ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN + 1]

Node name

uint16\_t **comp\_length**

Length of Composition Data

**uint8\_t \*comp\_data**  
Value of Composition Data

**struct esp\_ble\_mesh\_fast\_prov\_info\_t**  
Context of fast provisioning which need to be set.

### Public Members

**uint16\_t unicast\_min**  
Minimum unicast address used for fast provisioning

**uint16\_t unicast\_max**  
Maximum unicast address used for fast provisioning

**uint16\_t net\_idx**  
Netkey index used for fast provisioning

**uint8\_t flags**  
Flags used for fast provisioning

**uint32\_t iv\_index**  
IV Index used for fast provisioning

**uint8\_t offset**  
Offset of the UUID to be compared

**uint8\_t match\_len**  
Length of the UUID to be compared

**uint8\_t match\_val[16]**  
Value of UUID to be compared

**struct esp\_ble\_mesh\_heartbeat\_filter\_info\_t**  
Context of Provisioner heartbeat filter information to be set

### Public Members

**uint16\_t hb\_src**  
Heartbeat source address (unicast address)

**uint16\_t hb\_dst**  
Heartbeat destination address (unicast address or group address)

**struct esp\_ble\_mesh\_client\_op\_pair\_t**  
BLE Mesh client models related definitions.  
Client model Get/Set message opcode and corresponding Status message opcode

### Public Members

**uint32\_t cli\_op**  
The client message opcode

**uint32\_t status\_op**  
The server status opcode corresponding to the client message opcode

**struct esp\_ble\_mesh\_client\_t**  
Client Model user data context.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model. Initialized by the stack.

int **op\_pair\_size**

Size of the op\_pair

const *esp\_ble\_mesh\_client\_op\_pair\_t* \***op\_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32\_t **publish\_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void \***internal\_data**

Pointer to the internal data of client model

uint8\_t **msg\_role**

Role of the device (Node/Provisioner) that is going to send messages

**struct esp\_ble\_mesh\_client\_common\_param\_t**

Common parameters of the messages sent by Client Model.

### Public Members

*esp\_ble\_mesh\_opcode\_t* **opcode**

Message opcode

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

The context used to send message

int32\_t **msg\_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8\_t **msg\_role**

Role of the device - Node/Provisioner

**struct esp\_ble\_mesh\_state\_transition\_t**

Parameters of the server model state transition

### Public Functions

**BLE\_MESH\_ATOMIC\_DEFINE** (flag, *ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp\_ble\_mesh\_state\_transition\_t* sets “set\_auto\_rsp” to *ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

bool **just\_started**

Indicate if the state transition has just started

uint8\_t **trans\_time**

State transition time

**uint8\_t remain\_time**  
Remaining time of state transition

**uint8\_t delay**  
Delay before starting state transition

**uint32\_t quo\_tt**  
Duration of each divided transition step

**uint32\_t counter**  
Number of steps which the transition duration is divided

**uint32\_t total\_duration**  
State transition total duration

**int64\_t start\_timestamp**  
Time when the state transition is started

**struct k\_delayed\_work timer**  
Timer used for state transition

**struct esp\_ble\_mesh\_last\_msg\_info\_t**  
Parameters of the server model received last same set message.

### Public Members

**uint8\_t tid**  
Transaction number of the last message

**uint16\_t src**  
Source address of the last message

**uint16\_t dst**  
Destination address of the last message

**int64\_t timestamp**  
Time when the last message is received

**struct esp\_ble\_mesh\_server\_rsp\_ctrl\_t**  
Parameters of the Server Model response control

### Public Members

**uint8\_t get\_auto\_rsp : 1**  
BLE Mesh Server Response Option.

1. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;Response control for Client Get messages

**uint8\_t set\_auto\_rsp : 1**  
Response control for Client Set messages

**uint8\_t status\_auto\_rsp : 1**  
Response control for Server Status messages

**Macros****ESP\_BLE\_HOST\_STATUS\_ENABLED****ESP\_BLE\_HOST\_STATUS\_CHECK** (status)

The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC

**ESP\_BLE\_MESH\_SDU\_MAX\_LEN**

Length of a short Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_SHORT**

Length of a long Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_LONG**

The maximum length of a BLE Mesh provisioned node name

**ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN**

The maximum length of a BLE Mesh unprovisioned device name

**ESP\_BLE\_MESH\_DEVICE\_NAME\_MAX\_LEN**

The maximum length of settings user id

**ESP\_BLE\_MESH\_SETTINGS\_UID\_SIZE**

Invalid settings index

**ESP\_BLE\_MESH\_INVALID\_SETTINGS\_IDX**

Define the BLE Mesh octet 16 bytes size

**ESP\_BLE\_MESH\_OCTET16\_LEN****ESP\_BLE\_MESH\_OCTET8\_LEN****ESP\_BLE\_MESH\_CID\_NVAL**

Special TTL value to request using configured default TTL

**ESP\_BLE\_MESH\_TTL\_DEFAULT**

Maximum allowed TTL value

**ESP\_BLE\_MESH\_TTL\_MAX****ESP\_BLE\_MESH\_ADDR\_UNASSIGNED****ESP\_BLE\_MESH\_ADDR\_ALL\_NODES****ESP\_BLE\_MESH\_ADDR\_PROXIES****ESP\_BLE\_MESH\_ADDR\_FRIENDS****ESP\_BLE\_MESH\_ADDR\_RELAYS****ESP\_BLE\_MESH\_KEY\_UNUSED****ESP\_BLE\_MESH\_KEY\_DEV****ESP\_BLE\_MESH\_KEY\_PRIMARY****ESP\_BLE\_MESH\_KEY\_ANY**

Primary Network Key index

**ESP\_BLE\_MESH\_NET\_PRIMARY**

Relay state value

**ESP\_BLE\_MESH\_RELAY\_DISABLED****ESP\_BLE\_MESH\_RELAY\_ENABLED****ESP\_BLE\_MESH\_RELAY\_NOT\_SUPPORTED**

Beacon state value

**ESP\_BLE\_MESH\_BEACON\_DISABLED****ESP\_BLE\_MESH\_BEACON\_ENABLED**

GATT Proxy state value

**ESP\_BLE\_MESH\_GATT\_PROXY\_DISABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_ENABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_NOT\_SUPPORTED**

Friend state value

**ESP\_BLE\_MESH\_FRIEND\_DISABLED**

**ESP\_BLE\_MESH\_FRIEND\_ENABLED**

**ESP\_BLE\_MESH\_FRIEND\_NOT\_SUPPORTED**

Node identity state value

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_STOPPED**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_RUNNING**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED**

Supported features

**ESP\_BLE\_MESH\_FEATURE\_RELAY**

**ESP\_BLE\_MESH\_FEATURE\_PROXY**

**ESP\_BLE\_MESH\_FEATURE\_FRIEND**

**ESP\_BLE\_MESH\_FEATURE\_LOW\_POWER**

**ESP\_BLE\_MESH\_FEATURE\_ALL\_SUPPORTED**

**ESP\_BLE\_MESH\_ADDR\_IS\_UNICAST** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_GROUP** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_VIRTUAL** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_RFU** (addr)

**ESP\_BLE\_MESH\_INVALID\_NODE\_INDEX**

**ESP\_BLE\_MESH\_TRANSMIT** (count, int\_ms)

Encode transmission count & interval steps.

**Note** For example, `ESP_BLE_MESH_TRANSMIT(2, 20)` means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- `count`: Number of retransmissions (first transmission is excluded).
- `int_ms`: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_COUNT** (transmit)

Decode transmit count from a transmit value.

**Return** Transmission count (actual transmissions equal to  $N + 1$ ).

**Parameters**

- `transmit`: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Return** Transmission interval in milliseconds.

**Parameters**

- `transmit`: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_PUBLISH\_TRANSMIT** (count, int\_ms)

Encode Publish Retransmit count & interval steps.

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- `count`: Number of retransmissions (first transmission is excluded).
- `int_ms`: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Return** Retransmission count (actual transmissions equal to  $N + 1$ ).

**Parameters**

- `transmit`: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Return** Transmission interval in milliseconds.

**Parameters**

- `transmit`: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_PROV\_STATIC\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_OUTPUT\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_INPUT\_OOB\_MAX\_LEN**

Macros used to define message opcode

**ESP\_BLE\_MESH\_MODEL\_OP\_1** (b0)

**ESP\_BLE\_MESH\_MODEL\_OP\_2** (b0, b1)

**ESP\_BLE\_MESH\_MODEL\_OP\_3** (b0, cid)

This macro is associated with BLE\_MESH\_MODEL\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_SIG\_MODEL** (\_id, \_op, \_pub, \_user\_data)

This macro is associated with BLE\_MESH\_MODEL\_VND\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_VENDOR\_MODEL** (\_company, \_id, \_op, \_pub, \_user\_data)

**ESP\_BLE\_MESH\_ELEMENT** (\_loc, \_mods, \_vnd\_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP\_BLE\_MESH\_MODEL\_NONE can be given instead.

**Note** This macro is associated with BLE\_MESH\_ELEM in mesh\_access.h

**Parameters**

- `_loc`: Location Descriptor.
- `_mods`: Array of SIG models.
- `_vnd_mods`: Array of vendor models.

**ESP\_BLE\_MESH\_PROV** (uuid, sta\_val, sta\_val\_len, out\_size, out\_act, in\_size, in\_act)

**BT\_OCTET32\_LEN**

**BD\_ADDR\_LEN**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RANDOM**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_RANDOM**

**ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE** (\_name, \_msg\_len, \_role)

Define a model publication context.

**Parameters**

- `_name`: Variable name given to the context.

- `_msg_len`: Length of the publication message.
- `_role`: Role of the device which contains the model.

**ESP\_BLE\_MESH\_MODEL\_OP** (`_opcode`, `_min_len`)

Define a model operation context.

**Parameters**

- `_opcode`: Message opcode.
- `_min_len`: Message minimum length.

**ESP\_BLE\_MESH\_MODEL\_OP\_END**

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

**ESP\_BLE\_MESH\_MODEL\_NONE**

Helper to define an empty model array. This structure is associated with `BLE_MESH_MODEL_NONE` in `mesh_access.h`

**ADD\_DEV\_RM\_AFTER\_PROV\_FLAG**

Device will be removed from queue after provisioned successfully

**ADD\_DEV\_START\_PROV\_NOW\_FLAG**

Start provisioning device immediately

**ADD\_DEV\_FLUSHABLE\_DEV\_FLAG**

Device can be remove when queue is full and new device is going to added

**DEL\_DEV\_ADDR\_FLAG**

**DEL\_DEV\_UUID\_FLAG**

**PROV\_DATA\_NET\_IDX\_FLAG**

**PROV\_DATA\_FLAGS\_FLAG**

**PROV\_DATA\_IV\_INDEX\_FLAG**

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ACCEPTLIST**

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REJECTLIST**

Provisioner heartbeat filter operation

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ADD**

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REMOVE**

**ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_SRV**

BLE Mesh models related Model ID and Opcode definitions.

< Foundation Models

**ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_CLI**

**ESP\_BLE\_MESH\_MODEL\_ID\_HEALTH\_SRV**

**ESP\_BLE\_MESH\_MODEL\_ID\_HEALTH\_CLI**

Models from the Mesh Model Specification

**typedef** *UINT8* **BT\_OCTET32**[BT\_OCTET32\_LEN]

**typedef** uint8\_t **BD\_ADDR**[BD\_ADDR\_LEN]

**typedef** uint8\_t **esp\_ble\_mesh\_bd\_addr\_t**[BD\_ADDR\_LEN]

**typedef** uint8\_t **esp\_ble\_mesh\_addr\_type\_t**  
BLE device address type.

**typedef** **struct** *esp\_ble\_mesh\_model* **esp\_ble\_mesh\_model\_t**

**typedef** uint8\_t **esp\_ble\_mesh\_dev\_add\_flag\_t**

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_get\_t**  
*esp\_ble\_mesh\_opcode\_config\_client\_get\_t* belongs to *esp\_ble\_mesh\_opcode\_t*, this typedef is only used to locate the opcodes used by *esp\_ble\_mesh\_config\_client\_get\_state*. The following opcodes will only be used in the *esp\_ble\_mesh\_config\_client\_get\_state* function.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_client\_set\_t**

esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_status\_t**

esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

**typedef uint8\_t esp\_ble\_mesh\_cfg\_status\_t**

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_health\_client\_get\_t**

esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_get\_state function.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_health\_client\_set\_t**

esp\_ble\_mesh\_opcode\_health\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_set\_state function.

**typedef uint32\_t esp\_ble\_mesh\_health\_model\_status\_t**

esp\_ble\_mesh\_health\_model\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

**typedef uint32\_t esp\_ble\_mesh\_generic\_message\_opcode\_t**

esp\_ble\_mesh\_generic\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_generic\_client\_get\_state & esp\_ble\_mesh\_generic\_client\_set\_state. Generic OnOff Message Opcode

**typedef uint32\_t esp\_ble\_mesh\_sensor\_message\_opcode\_t**

esp\_ble\_mesh\_sensor\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_sensor\_client\_get\_state & esp\_ble\_mesh\_sensor\_client\_set\_state. Sensor Message Opcode

**typedef uint32\_t esp\_ble\_mesh\_time\_scene\_message\_opcode\_t**

esp\_ble\_mesh\_time\_scene\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_time\_scene\_client\_get\_state & esp\_ble\_mesh\_time\_scene\_client\_set\_state. Time Message Opcode

**typedef uint32\_t esp\_ble\_mesh\_light\_message\_opcode\_t**

esp\_ble\_mesh\_light\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_light\_client\_get\_state & esp\_ble\_mesh\_light\_client\_set\_state. Light Lightness Message Opcode

**typedef uint32\_t esp\_ble\_mesh\_opcode\_t**

End of defines of esp\_ble\_mesh\_opcode\_t

**typedef uint8\_t esp\_ble\_mesh\_model\_status\_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

**Enumerations****enum esp\_ble\_mesh\_cb\_type\_t**

Values:

**ESP\_BLE\_MESH\_TYPE\_PROV\_CB**

**ESP\_BLE\_MESH\_TYPE\_OUTPUT\_NUM\_CB**

```
ESP_BLE_MESH_TYPE_OUTPUT_STR_CB
ESP_BLE_MESH_TYPE_INTPUT_CB
ESP_BLE_MESH_TYPE_LINK_OPEN_CB

*Values:*

```
ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
    Initialize BLE Mesh provisioning capabilities and internal data information completion event

ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
    Set the unprovisioned device name completion event

ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
    Enable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
    Disable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
    Establish a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
    Close a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
    Generate Node input OOB public key event

ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
    Generate Node Output Number event

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
    Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
    Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
    Provisioning done event
```

- ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT**  
Provisioning reset event
- ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT**  
Node set oob public key completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Node input number completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Node input string completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_IDENTITY\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh Proxy Identity advertising completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh GATT Proxy Service completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_DISABLE\_COMP\_EVT**  
Disable BLE Mesh GATT Proxy Service completion event
- ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Node add NetKey locally completion event
- ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Node add AppKey locally completion event
- ESP\_BLE\_MESH\_NODE\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Node bind AppKey to model locally completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_ENABLE\_COMP\_EVT**  
Provisioner enable provisioning functionality completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DISABLE\_COMP\_EVT**  
Provisioner disable provisioning functionality completion event
- ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT**  
Provisioner receives unprovisioned device beacon event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT**  
Provisioner read unprovisioned device OOB public key event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_EVT**  
Provisioner input value for provisioning procedure event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_OUTPUT\_EVT**  
Provisioner output value for provisioning procedure event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_OPEN\_EVT**  
Provisioner establish a BLE Mesh link event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_CLOSE\_EVT**  
Provisioner close a BLE Mesh link event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT**  
Provisioner provisioning done event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_UNPROV\_DEV\_COMP\_EVT**  
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DEV\_WITH\_ADDR\_COMP\_EVT**  
Provisioner start to provision an unprovisioned device completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_DEV\_COMP\_EVT**  
Provisioner delete a device from the list, close provisioning link with the device completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_DEV\_UUID\_MATCH\_COMP\_EVT**  
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

- ESP\_BLE\_MESH\_PROVISIONER\_SET\_PROV\_DATA\_INFO\_COMP\_EVT**  
Provisioner set net\_idx/flags/iv\_index used for provisioning completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_STATIC\_OOB\_VALUE\_COMP\_EVT**  
Provisioner set static oob value used for provisioning completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_PRIMARY\_ELEM\_ADDR\_COMP\_EVT**  
Provisioner set unicast address of primary element completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_COMP\_EVT**  
Provisioner read unprovisioned device OOB public key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Provisioner input number completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Provisioner input string completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_NODE\_NAME\_COMP\_EVT**  
Provisioner set node name completion event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner add local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner update local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Provisioner bind local model with local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner add local network key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner update local network key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_STORE\_NODE\_COMP\_DATA\_COMP\_EVT**  
Provisioner store node composition data completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT**  
Provisioner delete node with uuid completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT**  
Provisioner delete node with unicast address completion event
- ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT**  
Provisioner start to receive heartbeat message completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT**  
Provisioner set the heartbeat filter type completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT**  
Provisioner set the heartbeat filter information completion event
- ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT**  
Provisioner receive heartbeat message event
- ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT**  
Provisioner directly erase settings completion event
- ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner open settings with index completion event
- ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner open settings with user id completion event
- ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner close settings with index completion event

- ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner close settings with user id completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner delete settings with index completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner delete settings with user id completion event
- ESP\_BLE\_MESH\_SET\_FAST\_PROV\_INFO\_COMP\_EVT**  
Set fast provisioning information (e.g. unicast address range, net\_idx, etc.) completion event
- ESP\_BLE\_MESH\_SET\_FAST\_PROV\_ACTION\_COMP\_EVT**  
Set fast provisioning action completion event
- ESP\_BLE\_MESH\_HEARTBEAT\_MESSAGE\_RECV\_EVT**  
Receive Heartbeat message event
- ESP\_BLE\_MESH\_LPN\_ENABLE\_COMP\_EVT**  
Enable Low Power Node completion event
- ESP\_BLE\_MESH\_LPN\_DISABLE\_COMP\_EVT**  
Disable Low Power Node completion event
- ESP\_BLE\_MESH\_LPN\_POLL\_COMP\_EVT**  
Low Power Node send Friend Poll completion event
- ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_ESTABLISH\_EVT**  
Low Power Node establishes friendship event
- ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_TERMINATE\_EVT**  
Low Power Node terminates friendship event
- ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_ESTABLISH\_EVT**  
Friend Node establishes friendship event
- ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT**  
Friend Node terminates friendship event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_ADV\_PKT\_EVT**  
Proxy Client receives Network ID advertising packet event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECTED\_EVT**  
Proxy Client establishes connection successfully event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECTED\_EVT**  
Proxy Client terminates connection successfully event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_FILTER\_STATUS\_EVT**  
Proxy Client receives Proxy Filter Status event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECT\_COMP\_EVT**  
Proxy Client connect completion event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECT\_COMP\_EVT**  
Proxy Client disconnect completion event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_SET\_FILTER\_TYPE\_COMP\_EVT**  
Proxy Client set filter type completion event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_ADD\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client add filter address completion event
- ESP\_BLE\_MESH\_PROXY\_CLIENT\_REMOVE\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client remove filter address completion event
- ESP\_BLE\_MESH\_MODEL\_SUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model subscribes group address completion event

**ESP\_BLE\_MESH\_MODEL\_UNSUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model unsubscribes group address completion event

**ESP\_BLE\_MESH\_DEINIT\_MESH\_COMP\_EVT**  
De-initialize BLE Mesh stack completion event

**ESP\_BLE\_MESH\_PROV\_EVT\_MAX**

**enum [anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

**ESP\_BLE\_MESH\_SERVER\_TRANS\_TIMER\_START**

**ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX**

**enum esp\_ble\_mesh\_server\_state\_type\_t**

This enum value is the type of server model states

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_ONOFF\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_LEVEL\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_ONPOWERUP\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_POWER\_ACTUAL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_ACTUAL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_LINEAR\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_CTL\_LIGHTNESS\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_CTL\_TEMP\_DELTA\_UV\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_LIGHTNESS\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_HUE\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_SATURATION\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_XYL\_LIGHTNESS\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LC\_LIGHT\_ONOFF\_STATE**

**ESP\_BLE\_MESH\_SERVER\_MODEL\_STATE\_MAX**

**enum esp\_ble\_mesh\_model\_cb\_event\_t**

*Values:*

**ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

**ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT**

User-defined models send messages completion event

**ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT**

User-defined models publish messages completion event

**ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT**

User-defined client models receive publish messages event

**ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

**ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

**ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT**

Server models update state value completion event

**ESP\_BLE\_MESH\_MODEL\_EVT\_MAX**

## ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

## ESP-BLE-MESH Stack Initialization

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_common\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_init** (*esp\_ble\_mesh\_prov\_t* \*prov, *esp\_ble\_mesh\_comp\_t* \*comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

*esp\_err\_t* **esp\_ble\_mesh\_deinit** (*esp\_ble\_mesh\_deinit\_param\_t* \*param)

De-initialize BLE Mesh module.

**Note** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] param: Pointer to the structure of BLE Mesh deinit parameters.

## Reading of Local Data Information

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_local\\_data\\_operation\\_api.h](#)

## Functions

`int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

### Parameters

- [in] `model`: Model instance pointer.

`uint16_t esp_ble_mesh_get_primary_element_address(void)`

Get the address of the primary element.

**Return** Address of the primary element on success, or `ESP_BLE_MESH_ADDR_UNASSIGNED` on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or `NULL` on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to `0x0000` in order to unsubscribe the model from the group.

### Parameters

- [in] `model`: Pointer to the model.
- [in] `group_addr`: Group address.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)`

Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or `NULL` on failure.

### Parameters

- [in] `element_addr`: Element address.

`uint8_t esp_ble_mesh_get_element_count(void)`

Get the number of elements that have been registered.

**Return** Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or `NULL` on failure which means the Vendor Model is not found.

### Parameters

- [in] `element`: Element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier assigned by the Bluetooth SIG.
- [in] `model_id`: A 16-bit vendor-assigned model identifier.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or `NULL` on failure which means the SIG Model is not found.

### Parameters

- [in] `element`: Element to which the model belongs.
- [in] `model_id`: SIG model identifier.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data(void)`

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or `NULL` on failure which means the Composition data is not initialized.

*esp\_err\_t* **esp\_ble\_mesh\_model\_subscribe\_group\_addr** (uint16\_t *element\_addr*, uint16\_t *company\_id*, uint16\_t *model\_id*, uint16\_t *group\_addr*)

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *element\_addr*: Unicast address of the element to which the model belongs.
- [in] *company\_id*: A 16-bit company identifier.
- [in] *model\_id*: A 16-bit model identifier.
- [in] *group\_addr*: The group address to be subscribed.

*esp\_err\_t* **esp\_ble\_mesh\_model\_unsubscribe\_group\_addr** (uint16\_t *element\_addr*, uint16\_t *company\_id*, uint16\_t *model\_id*, uint16\_t *group\_addr*)

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *element\_addr*: Unicast address of the element to which the model belongs.
- [in] *company\_id*: A 16-bit company identifier.
- [in] *model\_id*: A 16-bit model identifier.
- [in] *group\_addr*: The subscribed group address.

**const** uint8\_t\* **esp\_ble\_mesh\_node\_get\_local\_net\_key** (uint16\_t *net\_idx*)

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: NetKey index.

**const** uint8\_t\* **esp\_ble\_mesh\_node\_get\_local\_app\_key** (uint16\_t *app\_idx*)

This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**

- [in] *app\_idx*: AppKey index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_net\_key** (**const** uint8\_t *net\_key*[16], uint16\_t *net\_idx*)

This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *net\_key*: NetKey to be added.
- [in] *net\_idx*: NetKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_app\_key** (**const** uint8\_t *app\_key*[16], uint16\_t *net\_idx*, uint16\_t *app\_idx*)

This function is called by Node to add a local AppKey.

**Note** The *net\_idx* must be an existing one. This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *app\_key*: AppKey to be added.
- [in] *net\_idx*: NetKey Index.
- [in] *app\_idx*: AppKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_bind\_app\_key\_to\_local\_model** (uint16\_t *element\_addr*, uint16\_t *company\_id*, uint16\_t *model\_id*, uint16\_t *app\_idx*)

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind `app_key` with local vendor model, the `company_id` shall be set to `0xFFFF`. This function can only be called after the device is provisioned.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `element_addr`: Node local element address
- [in] `company_id`: Node local company id
- [in] `model_id`: Node local model id
- [in] `app_idx`: Node local appkey index

## Low Power Operation (Updating)

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_low\\_power\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_enable** (void)

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_disable** (bool *force*)

Disable BLE Mesh device LPN functionality.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `force`: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_poll** (void)

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the `PollTimeout` timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** `ESP_OK` on success or error code otherwise.

## Send/Publish Messages, add Local AppKey, etc.

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_networking\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_custom\_model\_callback** (*esp\_ble\_mesh\_model\_cb\_t* *callback*)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;

- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_model_msg_opcode_init` (uint8\_t \*data, uint32\_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `data`: Pointer to the message data.
- [in] `opcode`: The message opcode.

`esp_err_t esp_ble_mesh_client_model_init` (`esp_ble_mesh_model_t` \*model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `model`: BLE Mesh Client model to which the message belongs.

`esp_err_t esp_ble_mesh_client_model_deinit` (`esp_ble_mesh_model_t` \*model)

De-initialize the user-defined client model.

**Note** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `model`: Pointer of the Client model.

`esp_err_t esp_ble_mesh_server_model_send_msg` (`esp_ble_mesh_model_t` \*model, `esp_ble_mesh_msg_ctx_t` \*ctx, uint32\_t opcode, uint16\_t length, uint8\_t \*data)

Send server model messages (such as server model status messages).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `model`: BLE Mesh Server Model to which the message belongs.
- [in] `ctx`: Message context, includes keys, TTL, etc.
- [in] `opcode`: Message opcode.
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of Access Payload (exclude the message opcode) to be sent.

`esp_err_t esp_ble_mesh_client_model_send_msg` (`esp_ble_mesh_model_t` \*model, `esp_ble_mesh_msg_ctx_t` \*ctx, uint32\_t opcode, uint16\_t length, uint8\_t \*data, int32\_t msg\_timeout, bool need\_rsp, `esp_ble_mesh_dev_role_t` device\_role)

Send client model message (such as model get, set, etc).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `model`: BLE Mesh Client Model to which the message belongs.

- [in] `ctx`: Message context, includes keys, TTL, etc.
- [in] `opcode`: Message opcode.
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `msg_timeout`: Time to get response to the message (in milliseconds).
- [in] `need_rsp`: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] `device_role`: Role of the device (Node/Provisioner) that sends the message.

*esp\_err\_t* **esp\_ble\_mesh\_model\_publish** (*esp\_ble\_mesh\_model\_t* \*model, uint32\_t opcode, uint16\_t length, uint8\_t \*data, *esp\_ble\_mesh\_dev\_role\_t* device\_role)

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (*esp\_ble\_mesh\_model\_pub\_t:msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in `ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT` with the message updated.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `model`: Mesh (client) Model publishing the message.
- [in] `opcode`: Message opcode.
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `device_role`: Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

*esp\_err\_t* **esp\_ble\_mesh\_server\_model\_update\_state** (*esp\_ble\_mesh\_model\_t* \*model, *esp\_ble\_mesh\_server\_state\_type\_t* type, *esp\_ble\_mesh\_server\_state\_value\_t* \*value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `model`: Server model which is going to update the state.
- [in] `type`: Server model state type.
- [in] `value`: Server model state value.

*esp\_err\_t* **esp\_ble\_mesh\_node\_local\_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

**Return** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_node\_name** (uint16\_t index, const char \*name)

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `index`: Index of the node in the node queue.
- [in] `name`: Name (end by '\0') to be set for the node.

const char \***esp\_ble\_mesh\_provisioner\_get\_node\_name** (uint16\_t index)

This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`.

**Return** Node name on success, or NULL on failure.

**Parameters**

- [in] `index`: Index of the node in the node queue.

`uint16_t esp_ble_mesh_provisioner_get_node_index (const char *name)`

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**

- [in] name: Name of the node (end by '\0' ).

`esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)`

This function is called to store the Composition Data of the node.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] unicast\_addr: Element address of the node
- [in] data: Pointer of Composition Data
- [in] length: Length of Composition Data

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])`

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] uuid: Device UUID of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)`

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] unicast\_addr: Unicast address of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name (const char *name)`

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] name: Name of the node (end by '\0' ).

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)`

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

`const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)`

This function is called by Provisioner to get the entry of the node table.

**Note** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node's information. Before trying to read the node's information, users need to check if the node exists, i.e. if the `(esp_ble_mesh_node_t **node)` is NULL. For example: `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ... } }`

**Return** Pointer to the start of the node table.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])`

This function is called to delete the provisioned node information with the node device uuid.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uuid: Device UUID of the node

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_node\_with\_addr** (uint16\_t *unicast\_addr*)

This function is called to delete the provisioned node information with the node unicast address.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *unicast\_addr*: Unicast address of the node

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_local\_app\_key** (const uint8\_t *app\_key*[16],  
uint16\_t *net\_idx*, uint16\_t  
*app\_idx*)

This function is called to add a local AppKey for Provisioner.

**Note** *app\_key*: If set to NULL, *app\_key* will be generated internally. *net\_idx*: Should be an existing one.  
*app\_idx*: If it is going to be generated internally, it should be set to 0xFFFF, and the new *app\_idx* will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *app\_key*: The app key to be set for the local BLE Mesh stack.
- [in] *net\_idx*: The network key index.
- [in] *app\_idx*: The app key index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_update\_local\_app\_key** (const uint8\_t *app\_key*[16],  
uint16\_t *net\_idx*, uint16\_t  
*app\_idx*)

This function is used to update a local AppKey for Provisioner.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *app\_key*: Value of the AppKey.
- [in] *net\_idx*: Corresponding NetKey Index.
- [in] *app\_idx*: The AppKey Index

const uint8\_t \***esp\_ble\_mesh\_provisioner\_get\_local\_app\_key** (uint16\_t *net\_idx*, uint16\_t  
*app\_idx*)

This function is called by Provisioner to get the local app key value.

**Return** App key on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: Network key index.
- [in] *app\_idx*: Application key index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_bind\_app\_key\_to\_local\_model** (uint16\_t *el-*  
*ement\_addr*,  
uint16\_t *app\_idx*,  
uint16\_t  
*model\_id*,  
uint16\_t *com-*  
*pany\_id*)

This function is called by Provisioner to bind own model with proper app key.

**Note** *company\_id*: If going to bind *app\_key* with local vendor model, *company\_id* should be set to 0xFFFF.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *element\_addr*: Provisioner local element address
- [in] *app\_idx*: Provisioner local appkey index
- [in] *model\_id*: Provisioner local model id
- [in] *company\_id*: Provisioner local company id

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_local\_net\_key** (const uint8\_t *net\_key*[16],  
uint16\_t *net\_idx*)

This function is called by Provisioner to add local network key.

**Note** *net\_key*: If set to NULL, *net\_key* will be generated internally. *net\_idx*: If it is going to be generated internally, it should be set to 0xFFFF, and the new *net\_idx* will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] net\_key: The network key to be added to the Provisioner local BLE Mesh stack.
- [in] net\_idx: The network key index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_update\_local\_net\_key** (const uint8\_t net\_key[16],  
uint16\_t net\_idx)

This function is called by Provisioner to update a local network key.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] net\_key: Value of the NetKey.
- [in] net\_idx: The NetKey Index.

const uint8\_t \***esp\_ble\_mesh\_provisioner\_get\_local\_net\_key** (uint16\_t net\_idx)

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

- [in] net\_idx: Network key index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_recv\_heartbeat** (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] enable: Enable or disable receiving heartbeat messages.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_heartbeat\_filter\_type** (uint8\_t type)

This function is called by Provisioner to set the heartbeat filter type.

**Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] type: Heartbeat filter type (acceptlist or rejectlist).

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_heartbeat\_filter\_info** (uint8\_t op,  
*esp\_ble\_mesh\_heartbeat\_filter\_info\_t* \*info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] op: Add or REMOVE

- [in] info: Heartbeat filter entry information, including: hb\_src - Heartbeat source address; hb\_dst - Heartbeat destination address;

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_direct\_erase\_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_index** (uint8\_t *index*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_uid** (const char \**uid*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_index** (uint8\_t *index*, bool *erase*)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note** 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_uid** (const char \**uid*, bool *erase*)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note** 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_index** (uint8\_t *index*)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *index*: Settings index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_uid** (const char \**uid*)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *uid*: Settings user id.

const char \***esp\_ble\_mesh\_provisioner\_get\_settings\_uid** (uint8\_t *index*)

This function is called by Provisioner to get settings user id.

**Return** Setting user id on success or NULL on failure.

**Parameters**

- [in] *index*: Settings index.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_settings\_index** (const char \**uid*)

This function is called by Provisioner to get settings index.

**Return** Settings index.

**Parameters**

- [in] *uid*: Settings user id.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_free\_settings\_count** (void)

This function is called by Provisioner to get the number of free settings user id.

**Return** Number of free settings user id.

const uint8\_t \***esp\_ble\_mesh\_get\_fast\_prov\_app\_key** (uint16\_t *net\_idx*, uint16\_t *app\_idx*)

This function is called to get fast provisioning application key.

**Return** Application key on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: Network key index.
- [in] *app\_idx*: Application key index.

## Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t event,  
                                         esp_ble_mesh_model_cb_param_t *param)  
: event, event code of user-defined model events; param, parameters of user-defined model events
```

## ESP-BLE-MESH Node/Provisioner Provisioning

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_provisioning\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_prov\_callback** (*esp\_ble\_mesh\_prov\_cb\_t* *callback*)

Register BLE Mesh provisioning callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *callback*: Pointer to the callback function.

bool **esp\_ble\_mesh\_node\_is\_provisioned** (void)

Check if a device has been provisioned.

**Return** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* *bearers*)

Enable specific provisioning bearers to get the device ready for provisioning.

**Note** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- *bearers*: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* *bearers*)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- *bearers*: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_node\_set\_oob\_pub\_key** (uint8\_t *pub\_key\_x*[32], uint8\_t *pub\_key\_y*[32],  
uint8\_t *private\_key*[32])

Unprovisioned device set own oob public key & private key pair.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *pub\_key\_x*: Unprovisioned device' s Public Key X
- [in] *pub\_key\_y*: Unprovisioned device' s Public Key Y
- [in] *private\_key*: Unprovisioned device' s Private Key

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_number** (uint32\_t *number*)

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *number*: Number input by device.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_string** (const char \**string*)

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *string*: String input by device.

*esp\_err\_t* **esp\_ble\_mesh\_set\_unprovisioned\_device\_name** (const char \**name*)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn' t apply to PB-ADV mode.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *name*: Unprovisioned device name

```
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device's oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] link\_idx: The provisioning link index
- [in] pub\_key\_x: Unprovisioned device's Public Key X
- [in] pub\_key\_y: Unprovisioned device's Public Key Y

```
esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)
```

Provide provisioning input OOB string.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] string: String input by Provisioner.
- [in] link\_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] number: Number input by Provisioner.
- [in] link\_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov\_dev queue.

**Return** ESP\_OK on success or error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled, and cannot set flags with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
3. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
    - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_ADV enabled and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_GATT enabled, and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - Note: ESP\_BLE\_MESH\_PROV\_ADV, ESP\_BLE\_MESH\_PROV\_GATT and ADD\_DEV\_START\_PROV\_NOW\_FLAG can not be enabled at the same time.

#### Parameters

- [in] `add_dev`: Pointer to a struct containing the device information
- [in] `flags`: Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t
                                                         addr,
                                                         esp_ble_mesh_addr_type_t
                                                         addr_type,
                                                         esp_ble_mesh_prov_bearer_t
                                                         bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP\_BLE\_MESH\_PROV\_ADV or ESP\_BLE\_MESH\_PROV\_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
3. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.

#### Parameters

- [in] `uuid`: Device UUID of the unprovisioned device
- [in] `addr`: Device address of the unprovisioned device
- [in] `addr_type`: Device address type of the unprovisioned device
- [in] `bearer`: Provisioning bearer going to be used by Provisioner
- [in] `oob_info`: OOB info of the unprovisioned device
- [in] `unicast_addr`: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] del\_dev: Pointer to a struct containing the device information.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_dev\_uuid\_match** (const uint8\_t \*match\_val,  
uint8\_t match\_len, uint8\_t  
offset, bool prov\_after\_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] match\_val: Value to be compared with the part of the device UUID.
- [in] match\_len: Length of the compared match value.
- [in] offset: Offset of the device UUID to be compared (based on zero).
- [in] prov\_after\_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_prov\_data\_info** (*esp\_ble\_mesh\_prov\_data\_info\_t*  
\*prov\_data\_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] prov\_data\_info: Pointer to a struct containing net\_idx or flags or iv\_index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_static\_oob\_value** (const uint8\_t \*value,  
uint8\_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] value: Pointer to the static oob value.
- [in] length: Length of the static oob value.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_primary\_elem\_addr** (uint16\_t addr)

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov\_unicast\_addr value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] addr: Unicast address of the Primary element of Provisioner.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_info** (*esp\_ble\_mesh\_fast\_prov\_info\_t* \*fast\_prov\_info)

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `fast_prov_info`: Pointer to a struct containing unicast address range, `net_idx`, etc.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_action** (*esp\_ble\_mesh\_fast\_prov\_action\_t* *action*)

This function is called to start/suspend/exit fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `action`: fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```
typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t          event,
                                       esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t      addr,
                                           const esp_ble_mesh_addr_type_t     addr_type,
                                           const uint8_t                    adv_type,      const
                                           uint8_t *dev_uuid, uint16_t oob_info,
                                           esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**

- [in] `addr`: Pointer to the unprovisioned device address.
- [in] `addr_type`: Unprovisioned device address type.
- [in] `adv_type`: Adv packet type(ADV\_IND or ADV\_NONCONN\_IND).
- [in] `dev_uuid`: Unprovisioned device UUID pointer.
- [in] `oob_info`: OOB information of the unprovisioned device.
- [in] `bearer`: Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server****Header File**

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h`

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_identity\_enable** (void)

Enable advertising with Node Identity.

**Note** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_enable** (void)

Enable BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_connect** (*esp\_ble\_mesh\_bd\_addr\_t* *addr*,  
*esp\_ble\_mesh\_addr\_type\_t* *addr\_type*, *uint16\_t*  
*net\_idx*)

Proxy Client creates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *addr*: Device address of the Proxy Server.
- [in] *addr\_type*: Device address type(public or static random).
- [in] *net\_idx*: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_disconnect** (*uint8\_t* *conn\_handle*)

Proxy Client terminates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *conn\_handle*: Proxy connection handle.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_set\_filter\_type** (*uint8\_t* *conn\_handle*,  
*uint16\_t* *net\_idx*,  
*esp\_ble\_mesh\_proxy\_filter\_type\_t*  
*filter\_type*)

Proxy Client sets the filter type of the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *conn\_handle*: Proxy connection handle.
- [in] *net\_idx*: Corresponding NetKey Index.
- [in] *filter\_type*: whitelist or blacklist.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_add\_filter\_addr** (*uint8\_t* *conn\_handle*, *uint16\_t*  
*net\_idx*, *uint16\_t* \**addr*, *uint16\_t*  
*addr\_num*)

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *conn\_handle*: Proxy connection handle.
- [in] *net\_idx*: Corresponding NetKey Index.
- [in] *addr*: Pointer to the filter address.
- [in] *addr\_num*: Number of the filter address.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_remove\_filter\_addr** (*uint8\_t* *conn\_handle*, *uint16\_t*  
*net\_idx*, *uint16\_t* \**addr*,  
*uint16\_t* *addr\_num*)

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *conn\_handle*: Proxy connection handle.
- [in] *net\_idx*: Corresponding NetKey Index.
- [in] *addr*: Pointer to the filter address.
- [in] *addr\_num*: Number of the filter address.

## ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*

- [Time and Scenes Client/Server Models](#)
- [Lighting Client/Server Models](#)

---

**Note:** Definitions related to Server Models are being updated, and will be released soon.

---

## Configuration Client/Server Models

### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_config\\_model\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_client\_callback** (*esp\_ble\_mesh\_cfg\_client\_cb\_t* callback)

Register BLE Mesh Config Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_server\_callback** (*esp\_ble\_mesh\_cfg\_server\_cb\_t* callback)

Register BLE Mesh Config Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_get\_state\_t* \*get\_state)

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_set\_state\_t* \*set\_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

### Unions

```
union esp_ble_mesh_cfg_client_get_state_t
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
```

ESP\_BLE\_MESH\_MODEL\_OP\_MODEL\_PUB\_GET ESP\_BLE\_MESH\_MODEL\_OP\_FRIEND\_GET  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEARTBEAT\_PUB\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEARTBEAT\_SUB\_GET  
 the `get_state` parameter in the `esp_ble_mesh_config_client_get_state` function should not be set to NULL.

### Public Members

### Structures

**struct esp\_ble\_mesh\_cfg\_srv**  
Configuration Server Model context

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Configuration Server Model

uint8\_t **net\_transmit**  
Network Transmit state

**uint8\_t relay**  
Relay Mode state

**uint8\_t relay\_retransmit**  
Relay Retransmit state

**uint8\_t beacon**  
Secure Network Beacon state

**uint8\_t gatt\_proxy**  
GATT Proxy state

**uint8\_t friend\_state**  
Friend state

**uint8\_t default\_ttl**  
Default TTL

**struct k\_delayed\_work timer**  
Heartbeat Publication timer

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint16\_t count**  
Number of Heartbeat messages to be sent  
Number of Heartbeat messages received

**uint8\_t period**  
Period for sending Heartbeat messages

**uint8\_t ttl**  
TTL to be used when sending Heartbeat messages

**uint16\_t feature**  
Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
NetKey Index used by Heartbeat Publication

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_pub**  
Heartbeat Publication

**int64\_t expiry**  
Timestamp when Heartbeat subscription period is expired

**uint16\_t src**  
Source address for Heartbeat messages

**uint8\_t min\_hops**  
Minimum hops when receiving Heartbeat messages

**uint8\_t max\_hops**  
Maximum hops when receiving Heartbeat messages

**esp\_ble\_mesh\_cb\_t heartbeat\_recv\_cb**  
Optional heartbeat subscription tracking function

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_sub**  
Heartbeat Subscription

**struct esp\_ble\_mesh\_cfg\_composition\_data\_get\_t**  
Parameters of Config Composition Data Get.

**Public Members****uint8\_t page**

Page number of the Composition Data.

**struct esp\_ble\_mesh\_cfg\_model\_pub\_get\_t**

Parameters of Config Model Publication Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t**

Parameters of Config SIG Model Subscription Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**struct esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t**

Parameters of Config Vendor Model Subscription Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_app\_key\_get\_t**

Parameters of Config AppKey Get.

**Public Members****uint16\_t net\_idx**

The network key index

**struct esp\_ble\_mesh\_cfg\_node\_identity\_get\_t**

Parameters of Config Node Identity Get.

**Public Members**

`uint16_t net_idx`  
The network key index

`struct esp_ble_mesh_cfg_sig_model_app_get_t`  
Parameters of Config SIG Model App Get.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t model_id`  
The model id

`struct esp_ble_mesh_cfg_vnd_model_app_get_t`  
Parameters of Config Vendor Model App Get.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t model_id`  
The model id

`uint16_t company_id`  
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_kr_phase_get_t`  
Parameters of Config Key Refresh Phase Get.

**Public Members**

`uint16_t net_idx`  
The network key index

`struct esp_ble_mesh_cfg_lpn_polltimeout_get_t`  
Parameters of Config Low Power Node PollTimeout Get.

**Public Members**

`uint16_t lpn_addr`  
The unicast address of the Low Power node

`struct esp_ble_mesh_cfg_beacon_set_t`  
Parameters of Config Beacon Set.

**Public Members**

`uint8_t beacon`  
New Secure Network Beacon state

`struct esp_ble_mesh_cfg_default_ttl_set_t`  
Parameters of Config Default TTL Set.

**Public Members**

`uint8_t ttl`  
The default TTL state value

`struct esp_ble_mesh_cfg_friend_set_t`  
Parameters of Config Friend Set.

**Public Members**

`uint8_t friend_state`  
The friend state value

`struct esp_ble_mesh_cfg_gatt_proxy_set_t`  
Parameters of Config GATT Proxy Set.

**Public Members**

`uint8_t gatt_proxy`  
The GATT Proxy state value

`struct esp_ble_mesh_cfg_relay_set_t`  
Parameters of Config Relay Set.

**Public Members**

`uint8_t relay`  
The relay value

`uint8_t relay_retransmit`  
The relay retransmit value

`struct esp_ble_mesh_cfg_net_key_add_t`  
Parameters of Config NetKey Add.

**Public Members**

`uint16_t net_idx`  
The network key index

`uint8_t net_key[16]`  
The network key value

`struct esp_ble_mesh_cfg_app_key_add_t`  
Parameters of Config AppKey Add.

**Public Members**

`uint16_t net_idx`  
The network key index

`uint16_t app_idx`  
The app key index

`uint8_t app_key[16]`  
The app key value

`struct esp_ble_mesh_cfg_model_app_bind_t`  
Parameters of Config Model App Bind.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_app\_idx**

Index of the app key to bind with the model

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_pub\_set\_t**

Parameters of Config Model Publication Set.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t publish\_addr**

Value of the publish address

**uint16\_t publish\_app\_idx**

Index of the application key

**bool cred\_flag**

Value of the Friendship Credential Flag

**uint8\_t publish\_ttl**

Default TTL value for the publishing messages

**uint8\_t publish\_period**

Period for periodic status publishing

**uint8\_t publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t sub\_addr**

The address to be added to the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t sub\_addr**

The address to be removed from the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_overwrite\_t**

Parameters of Config Model Subscription Overwrite.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t sub\_addr**

The address to be added to the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_add\_t**

Parameters of Config Model Subscription Virtual Address Add.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

The Label UUID of the virtual address to be added to the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_delete\_t**

Parameters of Config Model Subscription Virtual Address Delete.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

The Label UUID of the virtual address to be removed from the Subscription List

**uint16\_t model\_id**

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

### Public Members

`uint16_t element_addr`

The element address

`uint8_t label_uuid[16]`

The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t**

Parameters of Config Model Publication Virtual Address Set.

### Public Members

`uint16_t element_addr`

The element address

`uint8_t label_uuid[16]`

Value of the Label UUID publish address

`uint16_t publish_app_idx`

Index of the application key

`bool cred_flag`

Value of the Friendship Credential Flag

`uint8_t publish_ttl`

Default TTL value for the publishing messages

`uint8_t publish_period`

Period for periodic status publishing

`uint8_t publish_retransmit`

Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t**

Parameters of Config Model Subscription Delete All.

### Public Members

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_net_key_update_t`

Parameters of Config NetKey Update.

### Public Members

`uint16_t net_idx`

The network key index

`uint8_t net_key[16]`

The network key value

`struct esp_ble_mesh_cfg_net_key_delete_t`

Parameters of Config NetKey Delete.

### Public Members

`uint16_t net_idx`

The network key index

`struct esp_ble_mesh_cfg_app_key_update_t`

Parameters of Config AppKey Update.

### Public Members

`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

`uint8_t app_key[16]`

The app key value

`struct esp_ble_mesh_cfg_app_key_delete_t`

Parameters of Config AppKey Delete.

### Public Members

`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

`struct esp_ble_mesh_cfg_node_identity_set_t`

Parameters of Config Node Identity Set.

### Public Members

`uint16_t net_idx`

The network key index

`uint8_t identity`

New Node Identity state

`struct esp_ble_mesh_cfg_model_app_unbind_t`

Parameters of Config Model App Unbind.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_app\_idx**

Index of the app key to bind with the model

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t**

Parameters of Config Key Refresh Phase Set.

**Public Members****uint16\_t net\_idx**

The network key index

**uint8\_t transition**

New Key Refresh Phase Transition

**struct esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t**

Parameters of Config Network Transmit Set.

**Public Members****uint8\_t net\_transmit**

Network Transmit State

**struct esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t**

Parameters of Config Model Heartbeat Publication Set.

**Public Members****uint16\_t dst**

Destination address for Heartbeat messages

**uint8\_t count**

Number of Heartbeat messages to be sent

**uint8\_t period**

Period for sending Heartbeat messages

**uint8\_t ttl**

TTL to be used when sending Heartbeat messages

**uint16\_t feature**

Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**

NetKey Index

**struct esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t**

Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

**uint16\_t src**  
Source address for Heartbeat messages

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t period**  
Period for receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t**  
Parameter of Config Beacon Status

**Public Members**

**uint8\_t beacon**  
Secure Network Beacon state value

**struct esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t**  
Parameters of Config Composition Data Status

**Public Members**

**uint8\_t page**  
Page number of the Composition Data

**struct net\_buf\_simple \*composition\_data**  
Pointer to Composition Data for the identified page

**struct esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t**  
Parameter of Config Default TTL Status

**Public Members**

**uint8\_t default\_ttl**  
Default TTL state value

**struct esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t**  
Parameter of Config GATT Proxy Status

**Public Members**

**uint8\_t gatt\_proxy**  
GATT Proxy state value

**struct esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t**  
Parameters of Config Relay Status

**Public Members**

**uint8\_t relay**  
Relay state value

**uint8\_t retransmit**  
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

**struct esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t**  
Parameters of Config Model Publication Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t publish\_addr**  
Value of the publish address

**uint16\_t app\_idx**  
Index of the application key

**bool cred\_flag**  
Value of the Friendship Credential Flag

**uint8\_t ttl**  
Default TTL value for the outgoing messages

**uint8\_t period**  
Period for periodic status publishing

**uint8\_t transmit**  
Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_model\_sub\_status\_cb\_t**  
Parameters of Config Model Subscription Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t sub\_addr**  
Value of the address

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t**  
Parameters of Config NetKey Status

### Public Members

**uint8\_t status**  
Status Code for the request message

`uint16_t net_idx`  
Index of the NetKey

`struct esp_ble_mesh_cfg_app_key_status_cb_t`  
Parameters of Config AppKey Status

### Public Members

`uint8_t status`  
Status Code for the request message

`uint16_t net_idx`  
Index of the NetKey

`uint16_t app_idx`  
Index of the application key

`struct esp_ble_mesh_cfg_mod_app_status_cb_t`  
Parameters of Config Model App Status

### Public Members

`uint8_t status`  
Status Code for the request message

`uint16_t element_addr`  
Address of the element

`uint16_t app_idx`  
Index of the application key

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

`struct esp_ble_mesh_cfg_friend_status_cb_t`  
Parameter of Config Friend Status

### Public Members

`uint8_t friend_state`  
Friend state value

`struct esp_ble_mesh_cfg_hb_pub_status_cb_t`  
Parameters of Config Heartbeat Publication Status

### Public Members

`uint8_t status`  
Status Code for the request message

`uint16_t dst`  
Destination address for Heartbeat messages

`uint8_t count`  
Number of Heartbeat messages remaining to be sent

`uint8_t period`  
Period for sending Heartbeat messages

**uint8\_t ttl**  
TTL to be used when sending Heartbeat messages

**uint16\_t features**  
Features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
Index of the NetKey

**struct esp\_ble\_mesh\_cfg\_hb\_sub\_status\_cb\_t**  
Parameters of Config Heartbeat Subscription Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t src**  
Source address for Heartbeat messages

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t period**  
Remaining Period for processing Heartbeat messages

**uint8\_t count**  
Number of Heartbeat messages received

**uint8\_t min\_hops**  
Minimum hops when receiving Heartbeat messages

**uint8\_t max\_hops**  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t**  
Parameters of Config Network Transmit Status

### Public Members

**uint8\_t net\_trans\_count : 3**  
Number of transmissions for each Network PDU originating from the node

**uint8\_t net\_trans\_step : 5**  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t**  
Parameters of Config SIG/Vendor Subscription List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct net\_buf\_simple \*sub\_addr**

A block of all addresses from the Subscription List

**struct esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t**

Parameter of Config NetKey List

### Public Members

**struct net\_buf\_simple \*net\_idx**

A list of NetKey Indexes known to the node

**struct esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t**

Parameters of Config AppKey List

### Public Members

**uint8\_t status**

Status Code for the request message

**uint16\_t net\_idx**

NetKey Index of the NetKey that the AppKeys are bound to

**struct net\_buf\_simple \*app\_idx**

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

**struct esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t**

Parameters of Config Node Identity Status

### Public Members

**uint8\_t status**

Status Code for the request message

**uint16\_t net\_idx**

Index of the NetKey

**uint8\_t identity**

Node Identity state

**struct esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t**

Parameters of Config SIG/Vendor Model App List

### Public Members

**uint8\_t status**

Status Code for the request message

**uint16\_t element\_addr**

Address of the element

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

**struct net\_buf\_simple \*app\_idx**

All AppKey indexes bound to the Model

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t**

Parameters of Config Key Refresh Phase Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint8\_t phase**  
Key Refresh Phase state

**struct esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t**  
Parameters of Config Low Power Node PollTimeout Status

**Public Members**

**uint16\_t lpn\_addr**  
The unicast address of the Low Power node

**int32\_t poll\_timeout**  
The current value of the PollTimeout timer of the Low Power node

**struct esp\_ble\_mesh\_cfg\_client\_cb\_param\_t**  
Configuration Client Model callback parameters

**Public Members**

**int error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \*params  
The client common parameters

*esp\_ble\_mesh\_cfg\_client\_common\_cb\_param\_t* status\_cb  
The config status message callback values

**struct esp\_ble\_mesh\_state\_change\_cfg\_mod\_pub\_set\_t**  
Configuration Server model related context.

New Key Refresh Phase Transition

**struct esp\_ble\_mesh\_cfg\_server\_cb\_param\_t**  
Configuration Server model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the server model structure

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received message

`esp_ble_mesh_cfg_server_cb_value_t value`  
Value of the received configuration messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_CFG\_SRV** (srv\_data)  
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

#### Parameters

- `srv_data`: Pointer to a unique Config Server Model `user_data`.

**ESP\_BLE\_MESH\_MODEL\_CFG\_CLI** (cli\_data)  
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

#### Parameters

- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

### Type Definitions

```
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```

Configuration Server Model context

```
typedef void (*esp_ble_mesh_cfg_client_cb_t) (esp_ble_mesh_cfg_client_cb_event_t event,  
                                              esp_ble_mesh_cfg_client_cb_param_t  
                                              *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_cfg_server_cb_t) (esp_ble_mesh_cfg_server_cb_event_t event,  
                                              esp_ble_mesh_cfg_server_cb_param_t  
                                              *param)
```

Configuration Server Model callback function type.

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

Values:

```
ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_cfg_server_cb_event_t
```

This enum value is the event of Configuration Server model

Values:

```
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
```

```
ESP_BLE_MESH_CFG_SERVER_EVT_MAX
```

### Health Client/Server Models

#### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_generic\\_model\\_api.h](#)

#### Functions

```
esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t  
                                                       callback)
```

Register BLE Mesh Generic Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *callback*: Pointer to the callback function.

```
esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t
                                                *params,
                                                esp_ble_mesh_generic_client_get_state_t
                                                *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to generic get message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_generic_client_set_state (esp_ble_mesh_client_common_param_t
                                                *params,
                                                esp_ble_mesh_generic_client_set_state_t
                                                *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to generic set message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_register_generic_server_callback (esp_ble_mesh_generic_server_cb_t
                                                         callback)
```

Register BLE Mesh Generic Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

```

Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_delta\_set\_t**  
Parameters of Generic Delta Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**int32\_t level**  
Delta change of Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_move\_set\_t**  
Parameters of Generic Move Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**int16\_t delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_set\_t**  
Parameter of Generic Default Transition Time Set.

### Public Members

**uint8\_t trans\_time**  
The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set.

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_set\_t**

Parameters of Generic Power Level Set.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set.

**Public Members****uint16\_t power**

The value of the Generic Power Default state

**struct esp\_ble\_mesh\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set.

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set.

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_set\_t**

Parameters of Generic Location Local Set.

**Public Members**

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_property\_get\_t**  
Parameter of Generic User Property Get.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**struct esp\_ble\_mesh\_gen\_user\_property\_set\_t**  
Parameters of Generic User Property Set.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property

**struct esp\_ble\_mesh\_gen\_admin\_property\_get\_t**  
Parameter of Generic Admin Property Get.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic Admin Property

**struct esp\_ble\_mesh\_gen\_admin\_property\_set\_t**  
Parameters of Generic Admin Property Set.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic Admin Property

**uint8\_t user\_access**  
Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**  
Raw value for the Admin Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_get\_t**  
Parameter of Generic Manufacturer Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_set\_t**  
Parameters of Generic Manufacturer Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

**struct esp\_ble\_mesh\_gen\_client\_properties\_get\_t**  
Parameter of Generic Client Properties Get.

**Public Members**

`uint16_t property_id`  
A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_gen\_onoff\_status\_cb\_t**  
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.  
Parameters of Generic OnOff Status.

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint8_t present_onoff`  
Current value of Generic OnOff state

`uint8_t target_onoff`  
Target value of Generic OnOff state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_level\_status\_cb\_t**  
Parameters of Generic Level Status.

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`int16_t present_level`  
Current value of Generic Level state

`int16_t target_level`  
Target value of the Generic Level state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_status\_cb\_t**  
Parameter of Generic Default Transition Time Status.

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_status\_cb\_t**

Parameter of Generic OnPowerUp Status.

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_status\_cb\_t**

Parameters of Generic Power Level Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_power**

Current value of Generic Power Actual state

**uint16\_t target\_power**

Target value of Generic Power Actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_power\_last\_status\_cb\_t**

Parameter of Generic Power Last Status.

**Public Members****uint16\_t power**

The value of the Generic Power Last state

**struct esp\_ble\_mesh\_gen\_power\_default\_status\_cb\_t**

Parameter of Generic Power Default Status.

**Public Members****uint16\_t power**

The value of the Generic Default Last state

**struct esp\_ble\_mesh\_gen\_power\_range\_status\_cb\_t**

Parameters of Generic Power Range Status.

**Public Members****uint8\_t status\_code**

Status Code for the request message

**uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_battery\_status\_cb\_t**  
Parameters of Generic Battery Status.

### Public Members

**uint32\_t battery\_level** : 8  
Value of Generic Battery Level state

**uint32\_t time\_to\_discharge** : 24  
Value of Generic Battery Time to Discharge state

**uint32\_t time\_to\_charge** : 24  
Value of Generic Battery Time to Charge state

**uint32\_t flags** : 8  
Value of Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t**  
Parameters of Generic Location Global Status.

### Public Members

**int32\_t global\_latitude**  
Global Coordinates (Latitude)

**int32\_t global\_longitude**  
Global Coordinates (Longitude)

**int16\_t global\_altitude**  
Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t**  
Parameters of Generic Location Local Status.

### Public Members

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t**  
Parameter of Generic User Properties Status.

### Public Members

**struct net\_buf\_simple \*property\_ids**  
Buffer contains a sequence of N User Property IDs

**struct esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t**  
Parameters of Generic User Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic User Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**

Raw value for the User Property (C.1)

**struct esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t**

Parameter of Generic Admin Properties Status.

**Public Members****struct net\_buf\_simple \*property\_ids**

Buffer contains a sequence of N Admin Property IDs

**struct esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t**

Parameters of Generic Admin Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic Admin Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**

Raw value for the Admin Property (C.1)

**struct esp\_ble\_mesh\_gen\_manufacturer\_properties\_status\_cb\_t**

Parameter of Generic Manufacturer Properties Status.

**Public Members****struct net\_buf\_simple \*property\_ids**

Buffer contains a sequence of N Manufacturer Property IDs

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_status\_cb\_t**

Parameters of Generic Manufacturer Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**  
Raw value for the Manufacturer Property (C.1)

**struct esp\_ble\_mesh\_gen\_client\_properties\_status\_cb\_t**  
Parameter of Generic Client Properties Status.

### Public Members

**struct net\_buf\_simple \*property\_ids**  
Buffer contains a sequence of N Client Property IDs

**struct esp\_ble\_mesh\_generic\_client\_cb\_param\_t**  
Generic Client Model callback parameters

### Public Members

**int error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \*params  
The client common parameters.

*esp\_ble\_mesh\_gen\_client\_status\_cb\_t* status\_cb  
The generic status message callback values

**struct esp\_ble\_mesh\_gen\_onoff\_state\_t**  
Parameters of Generic OnOff state

### Public Members

**uint8\_t onoff**  
The present value of the Generic OnOff state

**uint8\_t target\_onoff**  
The target value of the Generic OnOff state

**struct esp\_ble\_mesh\_gen\_onoff\_srv\_t**  
User data of Generic OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Generic OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onoff\_state\_t* state  
Parameters of the Generic OnOff state

*esp\_ble\_mesh\_last\_msg\_info\_t* last  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* transition  
Parameters of state transition

**struct esp\_ble\_mesh\_gen\_level\_state\_t**  
Parameters of Generic Level state

**Public Members****int16\_t level**

The present value of the Generic Level state

**int16\_t target\_level**

The target value of the Generic Level state

**int16\_t last\_level**

When a new transaction starts, level should be set to last\_last, and use “level + incoming delta” to calculate the target level. In another word, “last\_level” is used to record “level” of the last transaction, and “last\_delta” is used to record the previously received delta\_level value. The last value of the Generic Level state

**int32\_t last\_delta**

The last delta change of the Generic Level state

**bool move\_start**

Indicate if the transition of the Generic Level state has been started

**bool positive**

Indicate if the transition is positive or negative

**struct esp\_ble\_mesh\_gen\_level\_srv\_t**

User data of Generic Level Server Model

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_level\_state\_t* **state**

Parameters of the Generic Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

**int32\_t tt\_delta\_level**

Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t**

Parameter of Generic Default Transition Time state

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t**

User data of Generic Default Transition Time Server Model

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t* **state**

Parameters of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_state\_t**

Parameter of Generic OnPowerUp state

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t**

User data of Generic Power OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t**

User data of Generic Power OnOff Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_state\_t**

Parameters of Generic Power Level state

### Public Members

uint16\_t **power\_actual**

The present value of the Generic Power Actual state

uint16\_t **target\_power\_actual**

The target value of the Generic Power Actual state

uint16\_t **power\_last**

The value of the Generic Power Last state

uint16\_t **power\_default**

The value of the Generic Power Default state

uint8\_t **status\_code**

The status code of setting Generic Power Range state

`uint16_t power_range_min`  
The minimum value of the Generic Power Range state

`uint16_t power_range_max`  
The maximum value of the Generic Power Range state

**struct esp\_ble\_mesh\_gen\_power\_level\_srv\_t**  
User data of Generic Power Level Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`  
Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_level`  
Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t**  
User data of Generic Power Level Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`  
Parameters of the Generic Power Level state

**struct esp\_ble\_mesh\_gen\_battery\_state\_t**  
Parameters of Generic Battery state

### Public Members

`uint32_t battery_level : 8`  
The value of the Generic Battery Level state

`uint32_t time_to_discharge : 24`  
The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge : 24`  
The value of the Generic Battery Time to Charge state

`uint32_t battery_flags : 8`  
The value of the Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_battery\_srv\_t**  
User data of Generic Battery Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Battery Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_battery\_state\_t* **state**

Parameters of the Generic Battery state

**struct esp\_ble\_mesh\_gen\_location\_state\_t**

Parameters of Generic Location state

**Public Members**

int32\_t **global\_latitude**

The value of the Global Latitude field

int32\_t **global\_longitude**

The value of the Global Longitude field

int16\_t **global\_altitude**

The value of the Global Altitude field

int16\_t **local\_north**

The value of the Local North field

int16\_t **local\_east**

The value of the Local East field

int16\_t **local\_altitude**

The value of the Local Altitude field

uint8\_t **floor\_number**

The value of the Floor Number field

uint16\_t **uncertainty**

The value of the Uncertainty field

**struct esp\_ble\_mesh\_gen\_location\_srv\_t**

User data of Generic Location Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

**struct esp\_ble\_mesh\_gen\_location\_setup\_srv\_t**

User data of Generic Location Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* **\*state**

Parameters of the Generic Location state

**struct esp\_ble\_mesh\_generic\_property\_t**

Parameters of Generic Property states

### Public Members

uint16\_t **id**

The value of User/Admin/Manufacturer Property ID

uint8\_t **user\_access**

The value of User Access field

uint8\_t **admin\_access**

The value of Admin Access field

uint8\_t **manu\_access**

The value of Manufacturer Access field

**struct** net\_buf\_simple **\*val**

The value of User/Admin/Manufacturer Property

**struct esp\_ble\_mesh\_gen\_user\_prop\_srv\_t**

User data of Generic User Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* **\*model**

Pointer to the Generic User Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic User Property count

*esp\_ble\_mesh\_generic\_property\_t* **\*properties**

Parameters of the Generic User Property state

**struct esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t**

User data of Generic Admin Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* **\*model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic Admin Property count

*esp\_ble\_mesh\_generic\_property\_t* **\*properties**

Parameters of the Generic Admin Property state

**struct esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t**

User data of Generic Manufacturer Property Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic Manufacturer Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic Manufacturer Property state

**struct esp\_ble\_mesh\_gen\_client\_prop\_srv\_t**

User data of Generic Client Property Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **id\_count**

Generic Client Property ID count

uint16\_t \***property\_ids**

Parameters of the Generic Client Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_onoff\_set\_t**

Parameter of Generic OnOff Set state change event

**Public Members**

uint8\_t **onoff**

The value of Generic OnOff state

**struct esp\_ble\_mesh\_state\_change\_gen\_level\_set\_t**

Parameter of Generic Level Set state change event

**Public Members**

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_delta\_set\_t**

Parameter of Generic Delta Set state change event

**Public Members**

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_move\_set\_t**

Parameter of Generic Move Set state change event

**Public Members****int16\_t level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_def\_trans\_time\_set\_t**

Parameter of Generic Default Transition Time Set state change event

**Public Members****uint8\_t trans\_time**

The value of Generic Default Transition Time state

**struct esp\_ble\_mesh\_state\_change\_gen\_onpowerup\_set\_t**

Parameter of Generic OnPowerUp Set state change event

**Public Members****uint8\_t onpowerup**

The value of Generic OnPowerUp state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_level\_set\_t**

Parameter of Generic Power Level Set state change event

**Public Members****uint16\_t power**

The value of Generic Power Actual state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set state change event

**Public Members****uint16\_t power**

The value of Generic Power Default state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set state change event

**Public Members****uint16\_t range\_min**

The minimum value of Generic Power Range state

**uint16\_t range\_max**

The maximum value of Generic Power Range state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set state change event

**Public Members****int32\_t latitude**

The Global Latitude value of Generic Location state

**int32\_t longitude**  
The Global Longitude value of Generic Location state

**int16\_t altitude**  
The Global Altitude value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_local\_set\_t**  
Parameters of Generic Location Local Set state change event

### Public Members

**int16\_t north**  
The Local North value of Generic Location state

**int16\_t east**  
The Local East value of Generic Location state

**int16\_t altitude**  
The Local Altitude value of Generic Location state

**uint8\_t floor\_number**  
The Floor Number value of Generic Location state

**uint16\_t uncertainty**  
The Uncertainty value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_user\_property\_set\_t**  
Parameters of Generic User Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic User Property state

**struct net\_buf\_simple \*value**  
The property value of Generic User Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_admin\_property\_set\_t**  
Parameters of Generic Admin Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic Admin Property state

**uint8\_t access**  
The property access of Generic Admin Property state

**struct net\_buf\_simple \*value**  
The property value of Generic Admin Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_manu\_property\_set\_t**  
Parameters of Generic Manufacturer Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic Manufacturer Property state

**uint8\_t access**  
The property value of Generic Manufacturer Property state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_get\_t**  
Context of the received Generic User Property Get message

#### Public Members

uint16\_t **property\_id**  
Property ID identifying a Generic User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_get\_t**  
Context of the received Generic Admin Property Get message

#### Public Members

uint16\_t **property\_id**  
Property ID identifying a Generic Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_get\_t**  
Context of the received Generic Manufacturer Property message

#### Public Members

uint16\_t **property\_id**  
Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_client\_properties\_get\_t**  
Context of the received Generic Client Properties Get message

#### Public Members

uint16\_t **property\_id**  
A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onoff\_set\_t**  
Context of the received Generic OnOff Set message

#### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint8\_t **onoff**  
Target value of Generic OnOff state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_level\_set\_t**  
Context of the received Generic Level Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_delta\_set\_t**  
Context of the received Generic Delta Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int32\_t **delta\_level**  
Delta change of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_move\_set\_t**  
Context of the received Generic Move Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_def\_trans\_time\_set\_t**  
Context of the received Generic Default Transition Time Set message

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onpowerup\_set\_t**

Context of the received Generic OnPowerUp Set message

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t**

Context of the received Generic Power Level Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t**

Context of the received Generic Power Default Set message

**Public Members****uint16\_t power**

The value of the Generic Power Default state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t**

Context of the received Generic Power Range Set message

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t**

Context of the received Generic Location Global Set message

**Public Members**

`int32_t global_latitude`  
Global Coordinates (Latitude)

`int32_t global_longitude`  
Global Coordinates (Longitude)

`int16_t global_altitude`  
Global Altitude

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t**  
Context of the received Generic Location Local Set message

**Public Members**

`int16_t local_north`  
Local Coordinates (North)

`int16_t local_east`  
Local Coordinates (East)

`int16_t local_altitude`  
Local Altitude

`uint8_t floor_number`  
Floor Number

`uint16_t uncertainty`  
Uncertainty

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t**  
Context of the received Generic User Property Set message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t**  
Context of the received Generic Admin Property Set message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`uint8_t user_access`  
Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**  
Raw value for the Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t**  
Context of the received Generic Manufacturer Property Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

`struct esp_ble_mesh_generic_server_cb_param_t`  
Generic Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t value`  
Value of the received Generic Messages

### Macros

`ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Return** New Generic Level Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_CLI** (cli\_pub, cli\_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_PROPERTY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_SRV** (srv\_pub, srv\_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_gen\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_gen\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_SRV** (srv\_pub, srv\_data)

Define a new Generic Default Transition Time Server Model.

**Note** 1. The Generic Default Transition Time Server Model is a root model.  
1. This model shall support model publication and model subscription.

**Return** New Generic Default Transition Time Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Server Model.

**Note** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.

2. This model shall support model publication and model subscription.

**Return** New Generic Power OnOff Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Setup Server Model.

**Note** 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

**Return** New Generic Power OnOff Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power Level Server Model.

**Note** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Generic Power Level Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power Level Setup Server Model.

**Note** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Generic Power Level Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Battery Server Model.

**Note** 1. The Generic Battery Server Model is a root model.

1. This model shall support model publication and model subscription.

2. The model may be used to represent an element that is powered by a battery.

**Return** New Generic Battery Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Location Server Model.

**Note** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Location Setup Server Model.

**Note** 1. The Generic Location Setup Server model extends the Generic Location Server model.

1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_USER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic User Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ADMIN\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Admin Property Server Model.

**Note** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_MANUFACTURER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Manufacturer Property Server Model.

**Note** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_CLIENT\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic Client Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

### Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t) (esp_ble_mesh_generic_client_cb_event_t  
event,  
esp_ble_mesh_generic_client_cb_param_t  
*param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t) (esp_ble_mesh_generic_server_cb_event_t  
event,  
esp_ble_mesh_generic_server_cb_param_t  
*param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t  
This enum value is the event of Generic Client Model
```

*Values:*

```
ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_gen_user_prop_access_t  
This enum value is the access value of Generic User Property
```

*Values:*

```
ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_READ
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE
```

```
enum esp_ble_mesh_gen_admin_prop_access_t  
This enum value is the access value of Generic Admin Property
```

*Values:*

```
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE
```

```
enum esp_ble_mesh_gen_manu_prop_access_t  
This enum value is the access value of Generic Manufacturer Property
```

*Values:*

**ESP\_BLE\_MESH\_GEN\_MANU\_NOT\_USER\_PROP**

**ESP\_BLE\_MESH\_GEN\_MANU\_ACCESS\_READ**

**enum esp\_ble\_mesh\_generic\_server\_cb\_event\_t**

This enum value is the event of Generic Server Model

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_EVT\_MAX**

## Generic Client/Server Models

### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_health\\_model\\_api.h](#)

### Functions

**esp\_err\_t esp\_ble\_mesh\_register\_health\_client\_callback** (*esp\_ble\_mesh\_health\_client\_cb\_t*  
*callback*)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

**esp\_err\_t esp\_ble\_mesh\_register\_health\_server\_callback** (*esp\_ble\_mesh\_health\_server\_cb\_t*  
*callback*)

Register BLE Mesh Health Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

**esp\_err\_t esp\_ble\_mesh\_health\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t*  
*\*params, esp\_ble\_mesh\_health\_client\_get\_state\_t*  
*\*get\_state*)

This function is called to get the Health Server states using the Health Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_set\_state\_t* \*set\_state)

This function is called to set the Health Server states using the Health Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_health\_server\_fault\_update** (*esp\_ble\_mesh\_elem\_t* \*element)

This function is called by the Health Server Model to update the context of its Health Current status.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] element: The element to which the Health Server Model belongs.

## Unions

**union esp\_ble\_mesh\_health\_client\_get\_state\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_GET the get\_state parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

## Public Members

*esp\_ble\_mesh\_health\_fault\_get\_t* **fault\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET.

**union esp\_ble\_mesh\_health\_client\_set\_state\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK the set\_state parameter in the `esp_ble_mesh_health_client_set_state` function should not be set to NULL.

## Public Members

*esp\_ble\_mesh\_health\_attention\_set\_t* **attention\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK.

*esp\_ble\_mesh\_health\_period\_set\_t* **period\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK.

*esp\_ble\_mesh\_health\_fault\_test\_t* **fault\_test**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK.

*esp\_ble\_mesh\_health\_fault\_clear\_t* **fault\_clear**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK.

**union esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> Health Client Model received message union.

### Public Members

*esp\_ble\_mesh\_health\_current\_status\_cb\_t* **current\_status**

The health current status value

*esp\_ble\_mesh\_health\_fault\_status\_cb\_t* **fault\_status**

The health fault status value

*esp\_ble\_mesh\_health\_period\_status\_cb\_t* **period\_status**

The health period status value

*esp\_ble\_mesh\_health\_attention\_status\_cb\_t* **attention\_status**

The health attention status value

**union esp\_ble\_mesh\_health\_server\_cb\_param\_t**

*#include <esp\_ble\_mesh\_health\_model\_api.h>* Health Server Model callback parameters union.

### Public Members

*esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t* **fault\_update\_comp**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT

*esp\_ble\_mesh\_health\_fault\_clear\_cb\_t* **fault\_clear**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT

*esp\_ble\_mesh\_health\_fault\_test\_cb\_t* **fault\_test**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT

*esp\_ble\_mesh\_health\_attention\_on\_cb\_t* **attention\_on**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT

*esp\_ble\_mesh\_health\_attention\_off\_cb\_t* **attention\_off**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT

### Structures

**struct esp\_ble\_mesh\_health\_srv\_cb\_t**

ESP BLE Mesh Health Server callback

### Public Members

*esp\_ble\_mesh\_cb\_t* **fault\_clear**

Clear health registered faults. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **fault\_test**

Run a specific health test. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_on**

Health attention on callback. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_off**

Health attention off callback. Initialized by the stack.

**struct esp\_ble\_mesh\_health\_test\_t**

ESP BLE Mesh Health Server test Context

### Public Members

**uint8\_t id\_count**

Number of Health self-test ID

**const uint8\_t \*test\_ids**

Array of Health self-test IDs

`uint16_t` **company\_id**  
Company ID used to identify the Health Fault state

`uint8_t` **prev\_test\_id**  
Current test ID of the health fault test

`uint8_t` **current\_faults**[ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE]  
Array of current faults

`uint8_t` **registered\_faults**[ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE]  
Array of registered faults

**struct** **esp\_ble\_mesh\_health\_srv\_t**  
ESP BLE Mesh Health Server Model Context

### Public Members

`esp_ble_mesh_model_t` \***model**  
Pointer to Health Server Model

`esp_ble_mesh_health_srv_cb_t` **health\_cb**  
Health callback struct

**struct** `k_delayed_work` **attention\_timer**  
Attention Timer state

`bool` **attention\_timer\_start**  
Attention Timer start flag

`esp_ble_mesh_health_test_t` **health\_test**  
Health Server fault test

**struct** **esp\_ble\_mesh\_health\_fault\_get\_t**  
Parameter of Health Fault Get

### Public Members

`uint16_t` **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct** **esp\_ble\_mesh\_health\_attention\_set\_t**  
Parameter of Health Attention Set

### Public Members

`uint8_t` **attention**  
Value of the Attention Timer state

**struct** **esp\_ble\_mesh\_health\_period\_set\_t**  
Parameter of Health Period Set

### Public Members

`uint8_t` **fast\_period\_divisor**  
Divider for the Publish Period

**struct** **esp\_ble\_mesh\_health\_fault\_test\_t**  
Parameter of Health Fault Test

**Public Members**

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

`uint8_t test_id`  
ID of a specific test to be performed

**struct esp\_ble\_mesh\_health\_fault\_clear\_t**  
Parameter of Health Fault Clear

**Public Members**

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_current\_status\_cb\_t**  
Parameters of Health Current Status

**Public Members**

`uint8_t test_id`  
ID of a most recently performed test

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_fault\_status\_cb\_t**  
Parameters of Health Fault Status

**Public Members**

`uint8_t test_id`  
ID of a most recently performed test

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_period\_status\_cb\_t**  
Parameter of Health Period Status

**Public Members**

`uint8_t fast_period_divisor`  
Divider for the Publish Period

**struct esp\_ble\_mesh\_health\_attention\_status\_cb\_t**  
Parameter of Health Attention Status

**Public Members**

`uint8_t attention`  
Value of the Attention Timer state

**struct esp\_ble\_mesh\_health\_client\_cb\_param\_t**  
Health Client Model callback parameters

**Public Members**

`int error_code`  
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_health_client_common_cb_param_t status_cb`  
The health message status callback values

**struct esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t**  
Parameter of publishing Health Current Status completion event

**Public Members**

`int error_code`  
The result of publishing Health Current Status

`esp_ble_mesh_elem_t *element`  
Pointer to the element which contains the Health Server Model

**struct esp\_ble\_mesh\_health\_fault\_clear\_cb\_t**  
Parameters of Health Fault Clear event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_fault\_test\_cb\_t**  
Parameters of Health Fault Test event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

`uint8_t test_id`  
ID of a specific test to be performed

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_attention\_on\_cb\_t**  
Parameter of Health Attention On event

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Health Server Model

uint8\_t time  
Duration of attention timer on (in seconds)

struct esp\_ble\_mesh\_health\_attention\_off\_cb\_t  
Parameter of Health Attention Off event

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Health Server Model

### Macros

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV** (srv, pub)  
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

#### Parameters

- *srv*: Pointer to the unique struct *esp\_ble\_mesh\_health\_srv\_t*.
- *pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI** (cli\_data)  
Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

#### Parameters

- *cli\_data*: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE** (\_name, \_max, \_role)  
A helper to define a health publication context

#### Parameters

- *\_name*: Name given to the publication context variable.
- *\_max*: Maximum number of faults the element can have.
- *\_role*: Role of the device which contains the model.

**ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST**  
SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP\_BLE\_MESH\_NO\_FAULT**  
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

**ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING**

**ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_ERROR**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_WARNING**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_ERROR**

ESP\_BLE\_MESH\_NO\_LOAD\_WARNING  
ESP\_BLE\_MESH\_NO\_LOAD\_ERROR  
ESP\_BLE\_MESH\_OVERLOAD\_WARNING  
ESP\_BLE\_MESH\_OVERLOAD\_ERROR  
ESP\_BLE\_MESH\_OVERHEAT\_WARNING  
ESP\_BLE\_MESH\_OVERHEAT\_ERROR  
ESP\_BLE\_MESH\_CONDENSATION\_WARNING  
ESP\_BLE\_MESH\_CONDENSATION\_ERROR  
ESP\_BLE\_MESH\_VIBRATION\_WARNING  
ESP\_BLE\_MESH\_VIBRATION\_ERROR  
ESP\_BLE\_MESH\_CONFIGURATION\_WARNING  
ESP\_BLE\_MESH\_CONFIGURATION\_ERROR  
ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_WARNING  
ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_ERROR  
ESP\_BLE\_MESH\_MEMORY\_WARNING  
ESP\_BLE\_MESH\_MEMORY\_ERROR  
ESP\_BLE\_MESH\_SELF\_TEST\_WARNING  
ESP\_BLE\_MESH\_SELF\_TEST\_ERROR  
ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_WARNING  
ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_ERROR  
ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_WARNING  
ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_ERROR  
ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_WARNING  
ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_ERROR  
ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_WARNING  
ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_ERROR  
ESP\_BLE\_MESH\_HOUSING\_OPENED\_WARNING  
ESP\_BLE\_MESH\_HOUSING\_OPENED\_ERROR  
ESP\_BLE\_MESH\_TAMPER\_WARNING  
ESP\_BLE\_MESH\_TAMPER\_ERROR  
ESP\_BLE\_MESH\_DEVICE\_MOVED\_WARNING  
ESP\_BLE\_MESH\_DEVICE\_MOVED\_ERROR  
ESP\_BLE\_MESH\_DEVICE\_DROPPED\_WARNING  
ESP\_BLE\_MESH\_DEVICE\_DROPPED\_ERROR  
ESP\_BLE\_MESH\_OVERFLOW\_WARNING  
ESP\_BLE\_MESH\_OVERFLOW\_ERROR  
ESP\_BLE\_MESH\_EMPTY\_WARNING  
ESP\_BLE\_MESH\_EMPTY\_ERROR  
ESP\_BLE\_MESH\_INTERNAL\_BUS\_WARNING

**ESP\_BLE\_MESH\_INTERNAL\_BUS\_ERROR**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_WARNING**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_ERROR**

**ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE**

### Type Definitions

```
typedef void (*esp_ble_mesh_health_client_cb_t) (esp_ble_mesh_health_client_cb_event_t  
                                                event, esp_ble_mesh_health_client_cb_param_t  
                                                *param)
```

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_health_server_cb_t) (esp_ble_mesh_health_server_cb_event_t  
                                                event, esp_ble_mesh_health_server_cb_param_t  
                                                *param)
```

Health Server Model callback function type.

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_health_client_cb_event_t
```

This enum value is the event of Health Client Model

*Values:*

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_health_server_cb_event_t
```

This enum value is the event of Health Server Model

*Values:*

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_EVT\_MAX**

### Sensor Client/Server Models

#### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_lighting\\_model\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_light\_client\_callback** (*esp\_ble\_mesh\_light\_client\_cb\_t* callback)

Register BLE Mesh Light Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_get\_state\_t* \*get\_state)

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get\_state: Pointer of light get message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_set\_state\_t* \*set\_state)

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set\_state: Pointer of light set message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_register\_lighting\_server\_callback** (*esp\_ble\_mesh\_lighting\_server\_cb\_t* callback)

Register BLE Mesh Lighting Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

**Unions**

**union** `esp_ble_mesh_light_client_get_state_t`

Parameters of Light Lightness Range Set

**Public Members**

uint16\_t **range\_min**  
Value of range min field of light lightness range state

uint16\_t **range\_max**  
Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_light\_ctl\_set\_t**  
Parameters of Light CTL Set

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **ctl\_lightness**  
Target value of light ctl lightness state

uint16\_t **ctl\_temperatrue**  
Target value of light ctl temperature state

int16\_t **ctl\_delta\_uv**  
Target value of light ctl delta UV state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_set\_t**  
Parameters of Light CTL Temperature Set

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **ctl\_temperature**  
Target value of light ctl temperature state

int16\_t **ctl\_delta\_uv**  
Target value of light ctl delta UV state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_range\_set\_t**  
Parameters of Light CTL Temperature Range Set

### Public Members

uint16\_t **range\_min**  
Value of temperature range min field of light ctl temperature range state

uint16\_t **range\_max**  
Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_light\_ctl\_default\_set\_t**  
Parameters of Light CTL Default Set

### Public Members

uint16\_t **lightness**  
Value of light lightness default state

uint16\_t **temperature**  
Value of light temperature default state

int16\_t **delta\_uv**  
Value of light delta UV default state

**struct esp\_ble\_mesh\_light\_hsl\_set\_t**  
Parameters of Light HSL Set

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **hsl\_lightness**  
Target value of light hsl lightness state

uint16\_t **hsl\_hue**  
Target value of light hsl hue state

**uint16\_t hsl\_saturation**  
Target value of light hsl saturation state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_hue\_set\_t**  
Parameters of Light HSL Hue Set

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t hue**  
Target value of light hsl hue state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_saturation\_set\_t**  
Parameters of Light HSL Saturation Set

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t saturation**  
Target value of light hsl hue state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_default\_set\_t**  
Parameters of Light HSL Default Set

### Public Members

**uint16\_t lightness**  
Value of light lightness default state

**uint16\_t hue**  
Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

**struct esp\_ble\_mesh\_light\_hsl\_range\_set\_t**

Parameters of Light HSL Range Set

### Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_light\_xyl\_set\_t**

Parameters of Light xyL Set

### Public Members

`bool op_en`

Indicate whether optional parameters included

`uint16_t xyl_lightness`

The target value of the Light xyL Lightness state

`uint16_t xyl_x`

The target value of the Light xyL x state

`uint16_t xyl_y`

The target value of the Light xyL y state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_xyl\_default\_set\_t**

Parameters of Light xyL Default Set

### Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`uint16_t xyl_x`

The value of the Light xyL x Default state

`uint16_t xyl_y`

The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_light\_xyl\_range\_set\_t**

Parameters of Light xyL Range Set

**Public Members****uint16\_t xy1\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t xy1\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t xy1\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t xy1\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode Set

**Public Members****uint8\_t mode**

The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_set\_t**

Parameter of Light LC OM Set

**Public Members****uint8\_t mode**

The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t**

Parameters of Light LC Light OnOff Set

**Public Members****bool op\_en**

Indicate whether optional parameters included

**uint8\_t light\_onoff**

The target value of the Light LC Light OnOff state

**uint8\_t tid**

Transaction Identifier

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_get\_t**

Parameter of Light LC Property Get

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct esp\_ble\_mesh\_light\_lc\_property\_set\_t**

Parameters of Light LC Property Set

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the Light LC Property

**struct esp\_ble\_mesh\_light\_lightness\_status\_cb\_t**  
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.  
Parameters of Light Lightness Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_lightness**  
Current value of light lightness actual state

**uint16\_t target\_lightness**  
Target value of light lightness actual state (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_linear\_status\_cb\_t**  
Parameters of Light Lightness Linear Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_lightness**  
Current value of light lightness linear state

**uint16\_t target\_lightness**  
Target value of light lightness linear state (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t**  
Parameter of Light Lightness Last Status

**Public Members**

**uint16\_t lightness**  
The value of the Light Lightness Last state

**struct esp\_ble\_mesh\_light\_lightness\_default\_status\_cb\_t**  
Parameter of Light Lightness Default Status

**Public Members**

**uint16\_t lightness**  
The value of the Light Lightness default State

**struct esp\_ble\_mesh\_light\_lightness\_range\_status\_cb\_t**  
Parameters of Light Lightness Range Status

**Public Members**

**uint8\_t status\_code**  
Status Code for the request message

**uint16\_t range\_min**  
Value of range min field of light lightness range state

**uint16\_t range\_max**  
Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_light\_ctl\_status\_cb\_t**  
Parameters of Light CTL Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_ctl\_lightness**  
Current value of light ctl lightness state

**uint16\_t present\_ctl\_temperature**  
Current value of light ctl temperature state

**uint16\_t target\_ctl\_lightness**  
Target value of light ctl lightness state (optional)

**uint16\_t target\_ctl\_temperature**  
Target value of light ctl temperature state (C.1)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_status\_cb\_t**  
Parameters of Light CTL Temperature Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_ctl\_temperature**  
Current value of light ctl temperature state

**uint16\_t present\_ctl\_delta\_uv**  
Current value of light ctl delta UV state

**uint16\_t target\_ctl\_temperature**  
Target value of light ctl temperature state (optional)

**uint16\_t target\_ctl\_delta\_uv**  
Target value of light ctl delta UV state (C.1)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_range\_status\_cb\_t**  
Parameters of Light CTL Temperature Range Status

**Public Members****uint8\_t status\_code**

Status code for the request message

**uint16\_t range\_min**

Value of temperature range min field of light ctl temperature range state

**uint16\_t range\_max**

Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_light\_ctl\_default\_status\_cb\_t**

Parameters of Light CTL Default Status

**Public Members****uint16\_t lightness**

Value of light lightness default state

**uint16\_t temperature**

Value of light temperature default state

**int16\_t delta\_uv**

Value of light delta UV default state

**struct esp\_ble\_mesh\_light\_hsl\_status\_cb\_t**

Parameters of Light HSL Status

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t hsl\_lightness**

Current value of light hsl lightness state

**uint16\_t hsl\_hue**

Current value of light hsl hue state

**uint16\_t hsl\_saturation**

Current value of light hsl saturation state

**uint8\_t remain\_time**

Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_hsl\_target\_status\_cb\_t**

Parameters of Light HSL Target Status

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t hsl\_lightness\_target**

Target value of light hsl lightness state

**uint16\_t hsl\_hue\_target**

Target value of light hsl hue state

**uint16\_t hsl\_saturation\_target**

Target value of light hsl saturation state

`uint8_t remain_time`  
Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_hsl\_hue\_status\_cb\_t**  
Parameters of Light HSL Hue Status

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t present_hue`  
Current value of light hsl hue state

`uint16_t target_hue`  
Target value of light hsl hue state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_saturation\_status\_cb\_t**  
Parameters of Light HSL Saturation Status

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t present_saturation`  
Current value of light hsl saturation state

`uint16_t target_saturation`  
Target value of light hsl saturation state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_default\_status\_cb\_t**  
Parameters of Light HSL Default Status

### Public Members

`uint16_t lightness`  
Value of light lightness default state

`uint16_t hue`  
Value of light hue default state

`uint16_t saturation`  
Value of light saturation default state

**struct esp\_ble\_mesh\_light\_hsl\_range\_status\_cb\_t**  
Parameters of Light HSL Range Status

### Public Members

`uint8_t status_code`  
Status code for the request message

`uint16_t hue_range_min`  
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_light\_xyl\_status\_cb\_t**

Parameters of Light xyL Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

`uint16_t xyl_lightness`

The present value of the Light xyL Lightness state

`uint16_t xyl_x`

The present value of the Light xyL x state

`uint16_t xyl_y`

The present value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_target\_status\_cb\_t**

Parameters of Light xyL Target Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

`uint16_t target_xyl_lightness`

The target value of the Light xyL Lightness state

`uint16_t target_xyl_x`

The target value of the Light xyL x state

`uint16_t target_xyl_y`

The target value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_default\_status\_cb\_t**

Parameters of Light xyL Default Status

### Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`uint16_t xyl_x`

The value of the Light xyL x Default state

`uint16_t xyl_y`

The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_light\_xyl\_range\_status\_cb\_t**  
Parameters of Light xyL Range Status

#### Public Members

**uint8\_t status\_code**  
Status Code for the requesting message

**uint16\_t xyl\_x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t xyl\_x\_range\_max**  
The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t xyl\_y\_range\_min**  
The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t xyl\_y\_range\_max**  
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t**  
Parameter of Light LC Mode Status

#### Public Members

**uint8\_t mode**  
The present value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t**  
Parameter of Light LC OM Status

#### Public Members

**uint8\_t mode**  
The present value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t**  
Parameters of Light LC Light OnOff Status

#### Public Members

**bool op\_en**  
Indicate whether optional parameters included

**uint8\_t present\_light\_onoff**  
The present value of the Light LC Light OnOff state

**uint8\_t target\_light\_onoff**  
The target value of the Light LC Light OnOff state (Optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t**  
Parameters of Light LC Property Status

**Public Members**

`uint16_t property_id`  
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`  
Raw value for the Light LC Property

`struct esp_ble_mesh_light_client_cb_param_t`  
Lighting Client Model callback parameters

**Public Members**

`int error_code`  
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_light_client_status_cb_t status_cb`  
The light status message callback values

`struct esp_ble_mesh_light_lightness_state_t`  
Parameters of Light Lightness state

**Public Members**

`uint16_t lightness_linear`  
The present value of Light Lightness Linear state

`uint16_t target_lightness_linear`  
The target value of Light Lightness Linear state

`uint16_t lightness_actual`  
The present value of Light Lightness Actual state

`uint16_t target_lightness_actual`  
The target value of Light Lightness Actual state

`uint16_t lightness_last`  
The value of Light Lightness Last state

`uint16_t lightness_default`  
The value of Light Lightness Default state

`uint8_t status_code`  
The status code of setting Light Lightness Range state

`uint16_t lightness_range_min`  
The minimum value of Light Lightness Range state

`uint16_t lightness_range_max`  
The maximum value of Light Lightness Range state

`struct esp_ble_mesh_light_lightness_srv_t`  
User data of Light Lightness Server Model

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting Lightness Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* **\*state**  
Parameters of the Light Lightness state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **actual\_transition**  
Parameters of state transition

*esp\_ble\_mesh\_state\_transition\_t* **linear\_transition**  
Parameters of state transition

int32\_t **tt\_delta\_lightness\_actual**  
Delta change value of lightness actual state transition

int32\_t **tt\_delta\_lightness\_linear**  
Delta change value of lightness linear state transition

**struct esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t**  
User data of Light Lightness Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* **\*model**  
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* **\*state**  
Parameters of the Light Lightness state

**struct esp\_ble\_mesh\_light\_ctl\_state\_t**  
Parameters of Light CTL state

### Public Members

uint16\_t **lightness**  
The present value of Light CTL Lightness state

uint16\_t **target\_lightness**  
The target value of Light CTL Lightness state

uint16\_t **temperature**  
The present value of Light CTL Temperature state

uint16\_t **target\_temperature**  
The target value of Light CTL Temperature state

int16\_t **delta\_uv**  
The present value of Light CTL Delta UV state

int16\_t **target\_delta\_uv**  
The target value of Light CTL Delta UV state

uint8\_t **status\_code**  
The statue code of setting Light CTL Temperature Range state

uint16\_t **temperature\_range\_min**  
The minimum value of Light CTL Temperature Range state

uint16\_t **temperature\_range\_max**  
The maximum value of Light CTL Temperature Range state

`uint16_t lightness_default`  
The value of Light Lightness Default state

`uint16_t temperature_default`  
The value of Light CTL Temperature Default state

`int16_t delta_uv_default`  
The value of Light CTL Delta UV Default state

`struct esp_ble_mesh_light_ctl_srv_t`  
User data of Light CTL Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`  
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_lightness`  
Delta change value of lightness state transition

`int32_t tt_delta_temperature`  
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`  
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_setup_srv_t`  
User data of Light CTL Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`  
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`  
User data of Light CTL Temperature Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \*state

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* last

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* transition

Parameters of state transition

int32\_t tt\_delta\_temperature

Delta change value of temperature state transition

int32\_t tt\_delta\_delta\_uv

Delta change value of delta uv state transition

**struct esp\_ble\_mesh\_light\_hsl\_state\_t**

Parameters of Light HSL state

### Public Members

uint16\_t lightness

The present value of Light HSL Lightness state

uint16\_t target\_lightness

The target value of Light HSL Lightness state

uint16\_t hue

The present value of Light HSL Hue state

uint16\_t target\_hue

The target value of Light HSL Hue state

uint16\_t saturation

The present value of Light HSL Saturation state

uint16\_t target\_saturation

The target value of Light HSL Saturation state

uint16\_t lightness\_default

The value of Light Lightness Default state

uint16\_t hue\_default

The value of Light HSL Hue Default state

uint16\_t saturation\_default

The value of Light HSL Saturation Default state

uint8\_t status\_code

The status code of setting Light HSL Hue & Saturation Range state

uint16\_t hue\_range\_min

The minimum value of Light HSL Hue Range state

uint16\_t hue\_range\_max

The maximum value of Light HSL Hue Range state

uint16\_t saturation\_range\_min

The minimum value of Light HSL Saturation state

uint16\_t saturation\_range\_max

The maximum value of Light HSL Saturation state

**struct esp\_ble\_mesh\_light\_hsl\_srv\_t**

User data of Light HSL Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_hue**

Delta change value of hue state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t**

User data of Light HSL Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

**struct esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t**

User data of Light HSL Hue Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_hue**

Delta change value of hue state transition

**struct esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t**

User data of Light HSL Saturation Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_xyL\_state\_t**

Parameters of Light xyL state

### Public Members

uint16\_t **lightness**

The present value of Light xyL Lightness state

uint16\_t **target\_lightness**

The target value of Light xyL Lightness state

uint16\_t **x**

The present value of Light xyL x state

uint16\_t **target\_x**

The target value of Light xyL x state

uint16\_t **y**

The present value of Light xyL y state

uint16\_t **target\_y**

The target value of Light xyL y state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **x\_default**

The value of Light xyL x Default state

uint16\_t **y\_default**

The value of Light xyL y Default state

uint8\_t **status\_code**

The status code of setting Light xyL x & y Range state

uint16\_t **x\_range\_min**

The minimum value of Light xyL x Range state

uint16\_t **x\_range\_max**

The maximum value of Light xyL x Range state

uint16\_t **y\_range\_min**

The minimum value of Light xyL y Range state

uint16\_t **y\_range\_max**

The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_light\_xyl\_srv\_t**  
User data of Light xyL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting xyL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**  
Parameters of the Light xyL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**  
Parameters of state transition

int32\_t **tt\_delta\_lightness**  
Delta change value of lightness state transition

int32\_t **tt\_delta\_x**  
Delta change value of x state transition

int32\_t **tt\_delta\_y**  
Delta change value of y state transition

**struct esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t**  
User data of Light xyL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**  
Parameters of the Light xyL state

**struct esp\_ble\_mesh\_light\_lc\_state\_t**  
Parameters of Light LC states

### Public Members

uint32\_t **mode** : 1  
0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32\_t **occupancy\_mode** : 1  
The value of Light LC Occupancy Mode state

uint32\_t **light\_onoff** : 1  
The present value of Light LC Light OnOff state

uint32\_t **target\_light\_onoff** : 1  
The target value of Light LC Light OnOff state

`uint32_t occupancy` : 1

The value of Light LC Occupancy state

`uint32_t ambient_luxlevel` : 24

The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`

1. Light LC Linear Output =  $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed).The value of Light LC Linear Output state

**struct esp\_ble\_mesh\_light\_lc\_property\_state\_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

### Public Members

`uint32_t time_occupancy_delay`

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor.The value of Light LC Time Occupancy Delay state

`uint32_t time_fade_on`

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state.The value of Light LC Time Fade On state

`uint32_t time_run_on`

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state.The value of Light LC Time Run On state

`uint32_t time_fade`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state.The value of Light LC Time Fade state

`uint32_t time_prolong`

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state.The value of Light LC Time Prolong state

`uint32_t time_fade_standby_auto`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic.The value of Light LC Time Fade Standby Auto state

`uint32_t time_fade_standby_manual`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state.The value of Light LC Time Fade Standby Manual state

`uint16_t lightness_on`

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states.The value of Light LC Lightness On state

`uint16_t lightness_prolong`

A lightness state that determines the light lightness at the Prolong internal controller state.The value of Light LC Lightness Prolong state

**uint16\_t lightness\_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16\_t ambient\_luxlevel\_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16\_t ambient\_luxlevel\_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16\_t ambient\_luxlevel\_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**float regulator\_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**float regulator\_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**float regulator\_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**float regulator\_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**int8\_t regulator\_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**uint32\_t set\_occupancy\_to\_1\_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t**

Parameters of Light LC state machine

**Public Members****uint8\_t fade\_on**

The value of transition time of Light LC Time Fade On

**uint8\_t fade**

The value of transition time of Light LC Time Fade

`uint8_t fade_standby_auto`  
The value of transition time of Light LC Time Fade Standby Auto

`uint8_t fade_standby_manual`  
The value of transition time of Light LC Time Fade Standby Manual

**struct** `esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time`  
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

`esp_ble_mesh_light_lc_state_t state`  
The value of Light LC state machine state

**struct** `k_delayed_work timer`  
Timer of Light LC state machine

**struct** `esp_ble_mesh_light_control_t`  
Parameters of Light Lightness controller

### Public Members

`esp_ble_mesh_light_lc_state_t state`  
Parameters of Light LC state

`esp_ble_mesh_light_lc_property_state_t prop_state`  
Parameters of Light LC Property state

`esp_ble_mesh_light_lc_state_machine_t state_machine`  
Parameters of Light LC state machine

**struct** `esp_ble_mesh_light_lc_srv_t`  
User data of Light LC Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting LC Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`  
Parameters of the Light controller

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

**struct** `esp_ble_mesh_light_lc_setup_srv_t`  
User data of Light LC Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting LC Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \*lc

Parameters of the Light controller

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t**

Parameter of Light Lightness Actual state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Actual state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t**

Parameter of Light Lightness Linear state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Linear state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Default state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range state change event

### Public Members

uint16\_t **range\_min**

The minimum value of Light Lightness Range state

uint16\_t **range\_max**

The maximum value of Light Lightness Range state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_set\_t**

Parameters of Light CTL state change event

### Public Members

uint16\_t **lightness**

The value of Light CTL Lightness state

uint16\_t **temperature**

The value of Light CTL Temperature state

int16\_t **delta\_uv**

The value of Light CTL Delta UV state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature state change event

**Public Members**

`uint16_t temperature`  
The value of Light CTL Temperature state

`int16_t delta_uv`  
The value of Light CTL Delta UV state

`struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t`  
Parameters of Light CTL Temperature Range state change event

**Public Members**

`uint16_t range_min`  
The minimum value of Light CTL Temperature Range state

`uint16_t range_max`  
The maximum value of Light CTL Temperature Range state

`struct esp_ble_mesh_state_change_light_ctl_default_set_t`  
Parameters of Light CTL Default state change event

**Public Members**

`uint16_t lightness`  
The value of Light Lightness Default state

`uint16_t temperature`  
The value of Light CTL Temperature Default state

`int16_t delta_uv`  
The value of Light CTL Delta UV Default state

`struct esp_ble_mesh_state_change_light_hsl_set_t`  
Parameters of Light HSL state change event

**Public Members**

`uint16_t lightness`  
The value of Light HSL Lightness state

`uint16_t hue`  
The value of Light HSL Hue state

`uint16_t saturation`  
The value of Light HSL Saturation state

`struct esp_ble_mesh_state_change_light_hsl_hue_set_t`  
Parameter of Light HSL Hue state change event

**Public Members**

`uint16_t hue`  
The value of Light HSL Hue state

`struct esp_ble_mesh_state_change_light_hsl_saturation_set_t`  
Parameter of Light HSL Saturation state change event

**Public Members**

`uint16_t saturation`  
The value of Light HSL Saturation state

`struct esp_ble_mesh_state_change_light_hsl_default_set_t`  
Parameters of Light HSL Default state change event

**Public Members**

`uint16_t lightness`  
The value of Light HSL Lightness Default state

`uint16_t hue`  
The value of Light HSL Hue Default state

`uint16_t saturation`  
The value of Light HSL Saturation Default state

`struct esp_ble_mesh_state_change_light_hsl_range_set_t`  
Parameters of Light HSL Range state change event

**Public Members**

`uint16_t hue_range_min`  
The minimum hue value of Light HSL Range state

`uint16_t hue_range_max`  
The maximum hue value of Light HSL Range state

`uint16_t saturation_range_min`  
The minimum saturation value of Light HSL Range state

`uint16_t saturation_range_max`  
The maximum saturation value of Light HSL Range state

`struct esp_ble_mesh_state_change_light_xyl_set_t`  
Parameters of Light xyL state change event

**Public Members**

`uint16_t lightness`  
The value of Light xyL Lightness state

`uint16_t x`  
The value of Light xyL x state

`uint16_t y`  
The value of Light xyL y state

`struct esp_ble_mesh_state_change_light_xyl_default_set_t`  
Parameters of Light xyL Default state change event

**Public Members**

`uint16_t lightness`  
The value of Light Lightness Default state

`uint16_t x`  
The value of Light xyL x Default state

`uint16_t y`  
The value of Light xyL y Default state

**struct esp\_ble\_mesh\_state\_change\_light\_xyl\_range\_set\_t**  
Parameters of Light xyL Range state change event

### Public Members

`uint16_t x_range_min`  
The minimum value of Light xyL x Range state

`uint16_t x_range_max`  
The maximum value of Light xyL x Range state

`uint16_t y_range_min`  
The minimum value of Light xyL y Range state

`uint16_t y_range_max`  
The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_mode\_set\_t**  
Parameter of Light LC Mode state change event

### Public Members

`uint8_t mode`  
The value of Light LC Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_om\_set\_t**  
Parameter of Light LC Occupancy Mode state change event

### Public Members

`uint8_t mode`  
The value of Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_light\_onoff\_set\_t**  
Parameter of Light LC Light OnOff state change event

### Public Members

`uint8_t onoff`  
The value of Light LC Light OnOff state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_property\_set\_t**  
Parameters of Light LC Property state change event

### Public Members

`uint16_t property_id`  
The property id of Light LC Property state

**struct net\_buf\_simple \*property\_value**  
The property value of Light LC Property state

**struct esp\_ble\_mesh\_state\_change\_sensor\_status\_t**  
Parameters of Sensor Status state change event

**Public Members****uint16\_t property\_id**

The value of Sensor Property ID

**uint8\_t occupancy**

The value of Light LC Occupancy state

**uint32\_t set\_occupancy\_to\_1\_delay**

The value of Light LC Set Occupancy to 1 Delay state

**uint32\_t ambient\_luxlevel**

The value of Light LC Ambient Luxlevel state

**union esp\_ble\_mesh\_state\_change\_sensor\_status\_t::[anonymous] state**

Parameters of Sensor Status related state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_get\_t**

Context of the received Light LC Property Get message

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_set\_t**

Context of the received Light Lightness Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_linear\_set\_t**

Context of the received Light Lightness Linear Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness linear state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_default\_set\_t**

Context of the received Light Lightness Default Set message

### Public Members

**uint16\_t lightness**

The value of the Light Lightness Default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_range\_set\_t**

Context of the received Light Lightness Range Set message

### Public Members

**uint16\_t range\_min**

Value of range min field of light lightness range state

**uint16\_t range\_max**

Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_set\_t**

Context of the received Light CTL Set message

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light ctl lightness state

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_set\_t**

Context of the received Light CTL Temperature Set message

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_range\_set\_t**

Context of the received Light CTL Temperature Range Set message

### Public Members

**uint16\_t range\_min**

Value of temperature range min field of light ctl temperature range state

**uint16\_t range\_max**

Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_default\_set\_t**

Context of the received Light CTL Default Set message

### Public Members

**uint16\_t lightness**

Value of light lightness default state

**uint16\_t temperature**

Value of light temperature default state

**int16\_t delta\_uv**

Value of light delta UV default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_set\_t**

Context of the received Light HSL Set message

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light hsl lightness state

**uint16\_t hue**

Target value of light hsl hue state

**uint16\_t saturation**

Target value of light hsl saturation state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_hue\_set\_t**

Context of the received Light HSL Hue Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **hue**  
Target value of light hsl hue state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_saturation\_set\_t**  
Context of the received Light HSL Saturation Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **saturation**  
Target value of light hsl hue state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_default\_set\_t**  
Context of the received Light HSL Default Set message

**Public Members**

uint16\_t **lightness**  
Value of light lightness default state

uint16\_t **hue**  
Value of light hue default state

uint16\_t **saturation**  
Value of light saturation default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_range\_set\_t**  
Context of the received Light HSL Range Set message

**Public Members**

uint16\_t **hue\_range\_min**  
Value of hue range min field of light hsl hue range state

uint16\_t **hue\_range\_max**  
Value of hue range max field of light hsl hue range state

**uint16\_t saturation\_range\_min**  
Value of saturation range min field of light hsl saturation range state

**uint16\_t saturation\_range\_max**  
Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_set\_t**  
Context of the received Light xyL Set message

### Public Members

**bool op\_en**  
Indicate whether optional parameters included

**uint16\_t lightness**  
The target value of the Light xyL Lightness state

**uint16\_t x**  
The target value of the Light xyL x state

**uint16\_t y**  
The target value of the Light xyL y state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_default\_set\_t**  
Context of the received Light xyL Default Set message

### Public Members

**uint16\_t lightness**  
The value of the Light Lightness Default state

**uint16\_t x**  
The value of the Light xyL x Default state

**uint16\_t y**  
The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_range\_set\_t**  
Context of the received Light xyL Range Set message

### Public Members

**uint16\_t x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t x\_range\_max**  
The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t y\_range\_min**  
The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t y\_range\_max**  
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_mode\_set\_t**  
Context of the received Light LC Mode Set message

#### Public Members

**uint8\_t mode**  
The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_om\_set\_t**  
Context of the received Light OM Set message

#### Public Members

**uint8\_t mode**  
The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_light\_onoff\_set\_t**  
Context of the received Light LC Light OnOff Set message

#### Public Members

**bool op\_en**  
Indicate whether optional parameters included

**uint8\_t light\_onoff**  
The target value of the Light LC Light OnOff state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_set\_t**  
Context of the received Light LC Property Set message

#### Public Members

**uint16\_t property\_id**  
Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the Light LC Property

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_status\_t**  
Context of the received Sensor Status message

#### Public Members

**struct net\_buf\_simple \*data**  
Value of sensor data state (optional)

**struct esp\_ble\_mesh\_lighting\_server\_cb\_param\_t**  
Lighting Server Model callback parameters

## Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Lighting Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**  
Context of the received messages

*esp\_ble\_mesh\_lighting\_server\_cb\_value\_t* **value**  
Value of the received Lighting Messages

## Macros

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_CLI** (cli\_pub, cli\_data)  
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_CLI** (cli\_pub, cli\_data)  
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_CLI** (cli\_pub, cli\_data)  
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_CLI** (cli\_pub, cli\_data)  
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_CLI** (cli\_pub, cli\_data)  
Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SRV** (srv\_pub, srv\_data)  
Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_TEMP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Server Model.

**Note** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**Return** New Light HSL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Setup Server Model.

**Note** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light HSL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_HUE\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Hue Server Model.

**Note** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Hue Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SAT\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Saturation Server Model.

**Note** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Saturation Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Server Model.

**Note** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light xyL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Setup Server Model.

**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.  
1. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Server Model.

**Note** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Setup Server Model.

**Note** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

**Return** New Light LC Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

## Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t) (esp_ble_mesh_light_client_cb_event_t
                                              event, esp_ble_mesh_light_client_cb_param_t
                                              *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t) (esp_ble_mesh_lighting_server_cb_event_t
                                                  event,
                                                  esp_ble_mesh_lighting_server_cb_param_t
                                                  *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

```
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX
```

enum `esp_ble_mesh_lc_state_t`

This enum value is the Light LC State Machine states

*Values:*

```
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
```

enum `esp_ble_mesh_lighting_server_cb_event_t`

This enum value is the event of Lighting Server Model

*Values:*

```
ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
```

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
```

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
```

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
```

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

```
ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX
```

## Time and Scenes Client/Server Models

### Header File

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback` (`esp_ble_mesh_sensor_client_cb_t` *callback*)

Register BLE Mesh Sensor Client Model callback.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_sensor_client_get_state` (`esp_ble_mesh_client_common_param_t`  
`*params, esp_ble_mesh_sensor_client_get_state_t`  
`*get_state`)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to sensor get message value. Shall not be set to `NULL`.

`esp_err_t esp_ble_mesh_sensor_client_set_state` (`esp_ble_mesh_client_common_param_t`  
`*params, esp_ble_mesh_sensor_client_set_state_t`  
`*set_state`)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to sensor set message value. Shall not be set to `NULL`.

`esp_err_t esp_ble_mesh_register_sensor_server_callback` (`esp_ble_mesh_sensor_server_cb_t`  
`callback`)

Register BLE Mesh Sensor Server Model callback.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

**union** `esp_ble_mesh_sensor_client_get_state_t`  
`#include <esp_ble_mesh_sensor_model_api.h>` Sensor Client Model get message union.

### Structures

**struct esp\_ble\_mesh\_sensor\_descriptor\_get\_t**  
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.  
Parameters of Sensor Descriptor Get

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID of a sensor (optional)

**struct esp\_ble\_mesh\_sensor\_cadence\_get\_t**  
Parameter of Sensor Cadence Get

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_cadence\_set\_t**  
Parameters of Sensor Cadence Set

**Public Members****uint16\_t property\_id**

Property ID for the sensor

**uint8\_t fast\_cadence\_period\_divisor : 7**

Divisor for the publish period

**uint8\_t status\_trigger\_type : 1**

The unit and format of the Status Trigger Delta fields

**struct net\_buf\_simple \*status\_trigger\_delta\_down**

Delta down value that triggers a status message

**struct net\_buf\_simple \*status\_trigger\_delta\_up**

Delta up value that triggers a status message

**uint8\_t status\_min\_interval**

Minimum interval between two consecutive Status messages

**struct net\_buf\_simple \*fast\_cadence\_low**

Low value for the fast cadence range

**struct net\_buf\_simple \*fast\_cadence\_high**

Fast value for the fast cadence range

**struct esp\_ble\_mesh\_sensor\_settings\_get\_t**

Parameter of Sensor Settings Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_get\_t**

Parameters of Sensor Setting Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**uint16\_t sensor\_setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_set\_t**

Parameters of Sensor Setting Set

**Public Members****uint16\_t sensor\_property\_id**

Property ID identifying a sensor

**uint16\_t sensor\_setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct net\_buf\_simple \*sensor\_setting\_raw**

Raw value for the setting

**struct esp\_ble\_mesh\_sensor\_get\_t**

Parameters of Sensor Get

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t property\_id**  
Property ID for the sensor (optional)

**struct esp\_ble\_mesh\_sensor\_column\_get\_t**  
Parameters of Sensor Column Get

**Public Members**

**uint16\_t property\_id**  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**  
Raw value identifying a column

**struct esp\_ble\_mesh\_sensor\_series\_get\_t**  
Parameters of Sensor Series Get

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t property\_id**  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x1**  
Raw value identifying a starting column (optional)

**struct net\_buf\_simple \*raw\_value\_x2**  
Raw value identifying an ending column (C.1)

**struct esp\_ble\_mesh\_sensor\_descriptor\_status\_cb\_t**  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.  
Parameter of Sensor Descriptor Status

**Public Members**

**struct net\_buf\_simple \*descriptor**  
Sequence of 8-octet sensor descriptors (optional)

**struct esp\_ble\_mesh\_sensor\_cadence\_status\_cb\_t**  
Parameters of Sensor Cadence Status

**Public Members**

**uint16\_t property\_id**  
Property for the sensor

**struct net\_buf\_simple \*sensor\_cadence\_value**  
Value of sensor cadence state

**struct esp\_ble\_mesh\_sensor\_settings\_status\_cb\_t**  
Parameters of Sensor Settings Status

**Public Members**

`uint16_t sensor_property_id`  
Property ID identifying a sensor

`struct net_buf_simple *sensor_setting_property_ids`  
A sequence of N sensor setting property IDs (optional)

`struct esp_ble_mesh_sensor_setting_status_cb_t`  
Parameters of Sensor Setting Status

**Public Members**

`bool op_en`  
Indicate id optional parameters are included

`uint16_t sensor_property_id`  
Property ID identifying a sensor

`uint16_t sensor_setting_property_id`  
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`  
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`  
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`  
Parameter of Sensor Status

**Public Members**

`struct net_buf_simple *marshalled_sensor_data`  
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`  
Parameters of Sensor Column Status

**Public Members**

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`  
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`  
Parameters of Sensor Series Status

**Public Members**

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`  
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`  
Sensor Client Model callback parameters

### Public Members

int **error\_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_sensor\_client\_status\_cb\_t* **status\_cb**

The sensor status message callback values

**struct esp\_ble\_mesh\_sensor\_descriptor\_t**

Parameters of Sensor Descriptor state

### Public Members

uint32\_t **positive\_tolerance** : 12

The value of Sensor Positive Tolerance field

uint32\_t **negative\_tolerance** : 12

The value of Sensor Negative Tolerance field

uint32\_t **sampling\_function** : 8

The value of Sensor Sampling Function field

uint8\_t **measure\_period**

The value of Sensor Measurement Period field

uint8\_t **update\_interval**

The value of Sensor Update Interval field

**struct esp\_ble\_mesh\_sensor\_setting\_t**

Parameters of Sensor Setting state

### Public Members

uint16\_t **property\_id**

The value of Sensor Setting Property ID field

uint8\_t **access**

The value of Sensor Setting Access field

**struct net\_buf\_simple** \***raw**

The value of Sensor Setting Raw field

**struct esp\_ble\_mesh\_sensor\_cadence\_t**

Parameters of Sensor Cadence state

### Public Members

uint8\_t **period\_divisor** : 7

The value of Fast Cadence Period Divisor field

uint8\_t **trigger\_type** : 1

The value of Status Trigger Type field

**struct net\_buf\_simple** \***trigger\_delta\_down**

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

**struct** net\_buf\_simple \***trigger\_delta\_up**  
The value of Status Trigger Delta Up field

uint8\_t **min\_interval**  
The value of Status Min Interval field

**struct** net\_buf\_simple \***fast\_cadence\_low**  
The value of Fast Cadence Low field

**struct** net\_buf\_simple \***fast\_cadence\_high**  
The value of Fast Cadence High field

**struct** esp\_ble\_mesh\_sensor\_data\_t  
Parameters of Sensor Data state

### Public Members

uint8\_t **format** : 1  
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 –16).  
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 –127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8\_t **length** : 7  
The value of the Sensor Data length

**struct** net\_buf\_simple \***raw\_value**  
The value of Sensor Data raw value

**struct** esp\_ble\_mesh\_sensor\_series\_column\_t  
Parameters of Sensor Series Column state

### Public Members

**struct** net\_buf\_simple \***raw\_value\_x**  
The value of Sensor Raw Value X field

**struct** net\_buf\_simple \***column\_width**  
The value of Sensor Column Width field

**struct** net\_buf\_simple \***raw\_value\_y**  
The value of Sensor Raw Value Y field

**struct** esp\_ble\_mesh\_sensor\_state\_t  
Parameters of Sensor states

### Public Members

uint16\_t **sensor\_property\_id**  
The value of Sensor Property ID field

[\*esp\\_ble\\_mesh\\_sensor\\_descriptor\\_t\*](#) **descriptor**  
Parameters of the Sensor Descriptor state

**const** uint8\_t **setting\_count**  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

[\*esp\\_ble\\_mesh\\_sensor\\_setting\\_t\*](#) \***settings**  
Parameters of the Sensor Setting state

*esp\_ble\_mesh\_sensor\_cadence\_t* \***cadence**

The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

*esp\_ble\_mesh\_sensor\_data\_t* **sensor\_data**

Parameters of the Sensor Data state

*esp\_ble\_mesh\_sensor\_series\_column\_t* **series\_column**

Parameters of the Sensor Series Column state

**struct esp\_ble\_mesh\_sensor\_srv\_t**

User data of Sensor Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Sensor Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

**const** uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

**struct esp\_ble\_mesh\_sensor\_setup\_srv\_t**

User data of Sensor Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

**const** uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

**struct esp\_ble\_mesh\_state\_change\_sensor\_cadence\_set\_t**

Parameters of Sensor Cadence Set state change event

### Public Members

uint16\_t **property\_id**

The value of Sensor Property ID state

uint8\_t **period\_divisor** : 7

The value of Fast Cadence Period Divisor state

uint8\_t **trigger\_type** : 1

The value of Status Trigger Type state

**struct** net\_buf\_simple \***trigger\_delta\_down**

The value of Status Trigger Delta Down state

**struct** net\_buf\_simple \***trigger\_delta\_up**  
The value of Status Trigger Delta Up state

uint8\_t **min\_interval**  
The value of Status Min Interval state

**struct** net\_buf\_simple \***fast\_cadence\_low**  
The value of Fast Cadence Low state

**struct** net\_buf\_simple \***fast\_cadence\_high**  
The value of Fast Cadence High state

**struct** esp\_ble\_mesh\_state\_change\_sensor\_setting\_set\_t  
Parameters of Sensor Setting Set state change event

### Public Members

uint16\_t **property\_id**  
The value of Sensor Property ID state

uint16\_t **setting\_property\_id**  
The value of Sensor Setting Property ID state

**struct** net\_buf\_simple \***setting\_value**  
The value of Sensor Property Value state

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_descriptor\_get\_t  
Context of the received Sensor Descriptor Get message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID of a sensor (optional)

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_get\_t  
Context of the received Sensor Cadence Get message

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_settings\_get\_t  
Context of the received Sensor Settings Get message

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_get\_t  
Context of the received Sensor Setting Get message

**Public Members**

`uint16_t property_id`  
Property ID of a sensor

`uint16_t setting_property_id`  
Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_get\_t**  
Context of the received Sensor Get message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t property_id`  
Property ID for the sensor (optional)

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_column\_get\_t**  
Context of the received Sensor Column Get message

**Public Members**

`uint16_t property_id`  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**  
Raw value identifying a column

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_series\_get\_t**  
Context of the received Sensor Series Get message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t property_id`  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value**  
Raw value containing X1 and X2 (optional)

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_set\_t**  
Context of the received Sensor Cadence Set message

**Public Members**

`uint16_t property_id`  
Property ID for the sensor

**struct net\_buf\_simple \*cadence**  
Value of Sensor Cadence state

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_set\_t**  
Context of the received Sensor Setting Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a sensor

`uint16_t setting_property_id`  
Setting ID identifying a setting within a sensor

`struct net_buf_simple *setting_raw`  
Raw value for the setting

`struct esp_ble_mesh_sensor_server_cb_param_t`  
Sensor Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Sensor Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_sensor_server_cb_value_t value`  
Value of the received Sensor Messages

### Macros

`ESP_BLE_MESH_MODEL_SENSOR_CLI` (`cli_pub`, `cli_data`)  
Define a new Sensor Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Sensor Client Model.

**Return** New Sensor Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SRV` (`srv_pub`, `srv_data`)  
Sensor Server Models related context.

Define a new Sensor Server Model.

**Note** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.

#### Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV` (`srv_pub`, `srv_data`)  
Define a new Sensor Setup Server Model.

**Note** 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.

#### Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

`ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID`  
Invalid Sensor Property ID

`ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN`  
Length of Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_DESCRIPTOR\_LEN**

Length of Sensor Descriptor state

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_POS\_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_NEG\_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_MEASURE\_PERIOD**

Not applicable Sensor Measurement Period

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_UPDATE\_INTERVAL**

Not applicable Sensor Update Interval

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_SETTING\_PROPERTY\_ID**

Invalid Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_PROPERTY\_ID\_LEN**

Length of Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_LEN**

Length of Sensor Setting Access

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ**

Sensor Setting Access - Read

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ\_WRITE**

Sensor Setting Access - Read &amp; Write

**ESP\_BLE\_MESH\_SENSOR\_DIVISOR\_TRIGGER\_TYPE\_LEN**

Length of Sensor Divisor Trigger Type

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_LEN**

Length of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_PERIOD\_DIVISOR\_MAX\_VALUE**

Maximum value of Sensor Period Divisor

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_MAX**

Maximum value of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_CHAR**

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_UINT16**

Sensor Status Trigger Type - Format Type “uint16”

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A**

Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B**

Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID\_LEN**

MPID length of Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID\_LEN**

MPID length of Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_ZERO\_LEN**

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_FORMAT** (\_data)

Get format of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting the format of the corresponding sensor data.

**Return** Format of the sensor data.

**Parameters**

- `_data`: Pointer to the start of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_LENGTH** (`_data`, `_fmt`)

Get length of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting the length of the corresponding sensor data.

**Return** Length (zero-based) of the sensor data.

**Parameters**

- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_PROPERTY\_ID** (`_data`, `_fmt`)

Get Sensor Property ID of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**

- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID** (`_len`, `_id`)

Generate a MPID value for sensor data with Format A.

**Note** 1. The Format field is 0b0 and indicates that Format A is used.

1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return** 2-octet MPID value for sensor data with Format A.

**Parameters**

- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID** (`_len`, `_id`)

Generate a MPID value for sensor data with Format B.

**Note** 1. The Format field is 0b1 and indicates Format B is used.

1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
2. The Property ID is a 16-bit bit field representing a Property ID.
3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return** 3-octet MPID value for sensor data with Format B.

**Parameters**

- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

## Type Definitions

```
typedef void (*esp_ble_mesh_sensor_client_cb_t) (esp_ble_mesh_sensor_client_cb_event_t
                                                event, esp_ble_mesh_sensor_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Parameters**

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t) (esp_ble_mesh_sensor_server_cb_event_t
                                                event, esp_ble_mesh_sensor_server_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

*Values:*

```
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

*Values:*

```
ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
```

```
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
```

```
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
```

```
ESP_BLE_MESH_SAMPLE_FUNC_RMS
```

```
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
```

```
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
```

```
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
```

```
ESP_BLE_MESH_SAMPLE_FUNC_COUNT
```

```
enum esp_ble_mesh_sensor_server_cb_event_t
```

This enum value is the event of Sensor Server Model

*Values:*

```
ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
```

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
```

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
```

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
```

## Lighting Client/Server Models

### Header File

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback` (*esp\_ble\_mesh\_time\_scene\_client\_cb\_t callback*)

Register BLE Mesh Time Scene Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_time_scene_client_get_state` (*esp\_ble\_mesh\_client\_common\_param\_t \*params, esp\_ble\_mesh\_time\_scene\_client\_get\_state\_t \*get\_state*)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to time scene get message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_time_scene_client_set_state` (*esp\_ble\_mesh\_client\_common\_param\_t \*params, esp\_ble\_mesh\_time\_scene\_client\_set\_state\_t \*set\_state*)

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to time scene set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_time_scene_server_callback` (*esp\_ble\_mesh\_time\_scene\_server\_cb\_t callback*)

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

Parameters of Time Zone Set

### Public Members

uint8\_t **time\_zone\_offset\_new**  
Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_tai\_utc\_delta\_set\_t**  
Parameters of TAI-UTC Delta Set

**Public Members**

`uint16_t tai_utc_delta_new`: 15  
Upcoming difference between TAI and UTC in seconds

`uint16_t padding`: 1  
Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change`[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_time\_role\_set\_t**  
Parameter of Time Role Set

**Public Members**

`uint8_t time_role`  
The Time Role for the element

**struct esp\_ble\_mesh\_scene\_store\_t**  
Parameter of Scene Store

**Public Members**

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_scene\_recall\_t**  
Parameters of Scene Recall

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t scene_number`  
The number of scenes to be recalled

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_scene\_delete\_t**  
Parameter of Scene Delete

**Public Members**

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_scheduler\_act\_get\_t**  
Parameter of Scheduler Action Get

**Public Members****uint8\_t index**

Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_scheduler\_act\_set\_t**

Parameters of Scheduler Action Set

**Public Members****uint64\_t index : 4**

Index of the Schedule Register entry to set

**uint64\_t year : 7**

Scheduled year for the action

**uint64\_t month : 12**

Scheduled month for the action

**uint64\_t day : 5**

Scheduled day of the month for the action

**uint64\_t hour : 5**

Scheduled hour for the action

**uint64\_t minute : 6**

Scheduled minute for the action

**uint64\_t second : 6**

Scheduled second for the action

**uint64\_t day\_of\_week : 7**

Schedule days of the week for the action

**uint64\_t action : 4**

Action to be performed at the scheduled time

**uint64\_t trans\_time : 8**

Transition time for this action

**uint16\_t scene\_number**

Transition time for this action

**struct esp\_ble\_mesh\_time\_status\_cb\_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t sub\_second**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority : 1**

0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta : 15**

Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_zone\_status\_cb\_t**  
Parameters of Time Zone Status

### Public Members

**uint8\_t time\_zone\_offset\_curr**  
Current local time zone offset

**uint8\_t time\_zone\_offset\_new**  
Upcoming local time zone offset

**uint8\_t tai\_zone\_change[5]**  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t**  
Parameters of TAI-UTC Delta Status

### Public Members

**uint16\_t tai\_utc\_delta\_curr : 15**  
Current difference between TAI and UTC in seconds

**uint16\_t padding\_1 : 1**  
Always 0b0. Other values are Prohibited.

**uint16\_t tai\_utc\_delta\_new : 15**  
Upcoming difference between TAI and UTC in seconds

**uint16\_t padding\_2 : 1**  
Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_time\_role\_status\_cb\_t**  
Parameter of Time Role Status

### Public Members

**uint8\_t time\_role**  
The Time Role for the element

**struct esp\_ble\_mesh\_scene\_status\_cb\_t**  
Parameters of Scene Status

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint8\_t status\_code**  
Status code of the last operation

**uint16\_t current\_scene**  
Scene Number of the current scene

**uint16\_t target\_scene**  
Scene Number of the target scene (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_scene\_register\_status\_cb\_t**  
Parameters of Scene Register Status

### Public Members

**uint8\_t status\_code**  
Status code for the previous operation

**uint16\_t current\_scene**  
Scene Number of the current scene

**struct net\_buf\_simple \*scenes**  
A list of scenes stored within an element

**struct esp\_ble\_mesh\_scheduler\_status\_cb\_t**  
Parameter of Scheduler Status

### Public Members

**uint16\_t schedules**  
Bit field indicating defined Actions in the Schedule Register

**struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t**  
Parameters of Scheduler Action Status

### Public Members

**uint64\_t index : 4**  
Enumerates (selects) a Schedule Register entry

**uint64\_t year : 7**  
Scheduled year for the action

**uint64\_t month : 12**  
Scheduled month for the action

**uint64\_t day : 5**  
Scheduled day of the month for the action

**uint64\_t hour : 5**  
Scheduled hour for the action

**uint64\_t minute : 6**  
Scheduled minute for the action

**uint64\_t second : 6**  
Scheduled second for the action

**uint64\_t day\_of\_week : 7**  
Schedule days of the week for the action

**uint64\_t action : 4**  
Action to be performed at the scheduled time

**uint64\_t trans\_time : 8**  
Transition time for this action

**uint16\_t scene\_number**  
Transition time for this action

**struct esp\_ble\_mesh\_time\_scene\_client\_cb\_param\_t**  
Time Scene Client Model callback parameters

### Public Members

**int error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**  
The client common parameters.

*esp\_ble\_mesh\_time\_scene\_client\_status\_cb\_t* **status\_cb**  
The scene status message callback values

**struct esp\_ble\_mesh\_time\_state\_t**  
Parameters of Time state

### Public Members

**uint8\_t tai\_seconds[5]**  
The value of the TAI Seconds state

**uint8\_t subsecond**  
The value of the Subsecond field

**uint8\_t uncertainty**  
The value of the Uncertainty field

**uint8\_t time\_zone\_offset\_curr**  
The value of the Time Zone Offset Current field

**uint8\_t time\_zone\_offset\_new**  
The value of the Time Zone Offset New state

**uint8\_t tai\_zone\_change[5]**  
The value of the TAI of Zone Chaneg field

**uint16\_t time\_authority : 1**  
The value of the Time Authority bit

**uint16\_t tai\_utc\_delta\_curr : 15**  
The value of the TAI-UTC Delta Current state

**uint16\_t tai\_utc\_delta\_new : 15**  
The value of the TAI-UTC Delta New state

**uint8\_t tai\_delta\_change[5]**  
The value of the TAI of Delta Change field

**struct esp\_ble\_mesh\_time\_state\_t::[anonymous] time**  
Parameters of the Time state

**uint8\_t time\_role**  
The value of the Time Role state

**struct esp\_ble\_mesh\_time\_srv\_t**  
User data of Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

**struct esp\_ble\_mesh\_time\_setup\_srv\_t**

User data of Time Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Time Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

**struct esp\_ble\_mesh\_scene\_register\_t**

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

uint16\_t **scene\_number**

The value of the Scene Number

uint8\_t **scene\_type**

The value of the Scene Type

**struct net\_buf\_simple** \***scene\_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

**struct esp\_ble\_mesh\_scenes\_state\_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

**const uint16\_t scene\_count**

The Scenes state's scene count

*esp\_ble\_mesh\_scene\_register\_t* \*scenes

Parameters of the Scenes state

**uint16\_t current\_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

**uint16\_t target\_scene**

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

**uint8\_t status\_code**

The status code of the last scene operation

**bool in\_progress**

Indicate if the scene transition is in progress

**struct esp\_ble\_mesh\_scene\_srv\_t**

User data of Scene Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model

Pointer to the Scene Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl

Response control of the server model received messages

*esp\_ble\_mesh\_scenes\_state\_t* \*state

Parameters of the Scenes state

*esp\_ble\_mesh\_last\_msg\_info\_t* last

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* transition

Parameters of state transition

**struct esp\_ble\_mesh\_scene\_setup\_srv\_t**

User data of Scene Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scene Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scenes\_state\_t* \***state**

Parameters of the Scenes state

**struct esp\_ble\_mesh\_schedule\_register\_t**

Parameters of Scheduler Register state

**Public Members**

bool **in\_use**

Indicate if the registered schedule is in use

uint64\_t **year** : 7

The value of Scheduled year for the action

uint64\_t **month** : 12

The value of Scheduled month for the action

uint64\_t **day** : 5

The value of Scheduled day of the month for the action

uint64\_t **hour** : 5

The value of Scheduled hour for the action

uint64\_t **minute** : 6

The value of Scheduled minute for the action

uint64\_t **second** : 6

The value of Scheduled second for the action

uint64\_t **day\_of\_week** : 7

The value of Schedule days of the week for the action

uint64\_t **action** : 4

The value of Action to be performed at the scheduled time

uint64\_t **trans\_time** : 8

The value of Transition time for this action

uint16\_t **scene\_number**

The value of Scene Number to be used for some actions

**struct esp\_ble\_mesh\_scheduler\_state\_t**

Parameters of Scheduler state

**Public Members**

const uint8\_t **schedule\_count**

Scheduler count

*esp\_ble\_mesh\_schedule\_register\_t* \***schedules**

Up to 16 scheduled entries

**struct esp\_ble\_mesh\_scheduler\_srv\_t**

User data of Scheduler Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

**struct esp\_ble\_mesh\_scheduler\_setup\_srv\_t**

User data of Scheduler Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

**struct esp\_ble\_mesh\_state\_change\_time\_set\_t**

Parameters of Time Set state change event

**Public Members**

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **subsecond**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority** : 1

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta\_curr** : 15

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset\_curr**

The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_status\_t**

Parameters of Time Status state change event

**Public Members**

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **subsecond**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_zone\_set\_t**  
Parameters of Time Zone Set state change event

### Public Members

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change[5]`  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t**  
Parameters of TAI UTC Delta Set state change event

### Public Members

`uint16_t tai_utc_delta_new : 15`  
Upcoming difference between TAI and UTC in seconds

`uint8_t tai_delta_change[5]`  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_state\_change\_time\_role\_set\_t**  
Parameter of Time Role Set state change event

### Public Members

`uint8_t time_role`  
The Time Role for the element

**struct esp\_ble\_mesh\_state\_change\_scene\_store\_t**  
Parameter of Scene Store state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_state\_change\_scene\_recall\_t**  
Parameter of Scene Recall state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be recalled

**struct esp\_ble\_mesh\_state\_change\_scene\_delete\_t**  
Parameter of Scene Delete state change event

**Public Members**

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_state\_change\_scheduler\_act\_set\_t**  
Parameter of Scheduler Action Set state change event

**Public Members**

`uint64_t index` : 4  
Index of the Schedule Register entry to set

`uint64_t year` : 7  
Scheduled year for the action

`uint64_t month` : 12  
Scheduled month for the action

`uint64_t day` : 5  
Scheduled day of the month for the action

`uint64_t hour` : 5  
Scheduled hour for the action

`uint64_t minute` : 6  
Scheduled minute for the action

`uint64_t second` : 6  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_get\_t**  
Context of the received Scheduler Action Get message

**Public Members**

`uint8_t index`  
Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_server\_rcv\_time\_set\_t**  
Context of the received Time Set message

**Public Members**

`uint8_t tai_seconds`[5]  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

**uint8\_t uncertainty**  
The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority** : 1  
0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta** : 15  
Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_server\_rcv\_time\_zone\_set\_t**  
Context of the received Time Zone Set message

### Public Members

**uint8\_t time\_zone\_offset\_new**  
Upcoming local time zone offset

**uint8\_t tai\_zone\_change**[5]  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_server\_rcv\_tai\_utc\_delta\_set\_t**  
Context of the received TAI UTC Delta Set message

### Public Members

**uint16\_t tai\_utc\_delta\_new** : 15  
Upcoming difference between TAI and UTC in seconds

**uint16\_t padding** : 1  
Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change**[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_server\_rcv\_time\_role\_set\_t**  
Context of the received Time Role Set message

### Public Members

**uint8\_t time\_role**  
The Time Role for the element

**struct esp\_ble\_mesh\_server\_rcv\_scene\_store\_t**  
Context of the received Scene Store message

### Public Members

**uint16\_t scene\_number**  
The number of scenes to be stored

**struct esp\_ble\_mesh\_server\_rcv\_scene\_recall\_t**  
Context of the received Scene Recall message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **scene\_number**  
The number of scenes to be recalled

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_scene\_delete\_t**  
Context of the received Scene Delete message

**Public Members**

uint16\_t **scene\_number**  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_set\_t**  
Context of the received Scheduler Action Set message

**Public Members**

uint64\_t **index** : 4  
Index of the Schedule Register entry to set

uint64\_t **year** : 7  
Scheduled year for the action

uint64\_t **month** : 12  
Scheduled month for the action

uint64\_t **day** : 5  
Scheduled day of the month for the action

uint64\_t **hour** : 5  
Scheduled hour for the action

uint64\_t **minute** : 6  
Scheduled minute for the action

uint64\_t **second** : 6  
Scheduled second for the action

uint64\_t **day\_of\_week** : 7  
Schedule days of the week for the action

uint64\_t **action** : 4  
Action to be performed at the scheduled time

uint64\_t **trans\_time** : 8  
Transition time for this action

uint16\_t **scene\_number**  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_time\_status\_t**  
Context of the received Time Status message

### Public Members

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_scene\_server\_cb\_param\_t**  
Time Scene Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t value`  
Value of the received Time and Scenes Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_TIME\_CLI** (cli\_pub, cli\_data)  
Define a new Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Return** New Time Client Model instance.

#### Parameters

- cli\_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli\_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI** (cli\_pub, cli\_data)  
Define a new Scene Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Return** New Scene Client Model instance.

#### Parameters

- cli\_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli\_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI** (cli\_pub, cli\_data)  
Define a new Scheduler Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Return** New Scheduler Client Model instance.

#### Parameters

- cli\_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli\_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SRV** (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Time Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SETUP\_SRV** (srv\_data)

Define a new Time Setup Server Model.

**Note** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
2. This model does not support subscribing nor publishing.

**Return** New Time Setup Server Model instance.

**Parameters**

- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_time\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SRV** (srv\_pub, srv\_data)

Define a new Scene Server Model.

**Note** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_scene\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scene Setup Server Model.

**Note** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Setup Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_scene\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.
3. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_scheduler\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

1. This model shall support model subscription.

2. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS**

Unknown TAI Seconds

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE**

Unknown TAI of Zone Change

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE**

Unknown TAI of Delta Change

**ESP\_BLE\_MESH\_TAI\_UTC\_DELTA\_MAX\_VALUE**

Maximum TAI-UTC Delta value

**ESP\_BLE\_MESH\_TAI\_SECONDS\_LEN**

Length of TAI Seconds

**ESP\_BLE\_MESH\_TAI\_OF\_ZONE\_CHANGE\_LEN**

Length of TAI of Zone Change

**ESP\_BLE\_MESH\_TAI\_OF\_DELTA\_CHANGE\_LEN**

Length of TAI of Delta Change

**ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER**

Invalid Scene Number

**ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN**

Length of the Scene Number

**ESP\_BLE\_MESH\_SCHEDULE\_YEAR\_ANY\_YEAR**

Any year of the Scheduled year

**ESP\_BLE\_MESH\_SCHEDULE\_DAY\_ANY\_DAY**

Any day of the Scheduled day

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ANY\_HOUR**

Any hour of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ONCE\_A\_DAY**

Any hour of the Scheduled Day

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ANY\_OF\_HOUR**

Any minute of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_15\_MIN**

Every 15 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_MIN**

Every 20 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ONCE\_AN\_HOUR**

Once of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC ANY\_OF\_MIN**

Any second of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_15\_SEC**

Every 15 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_SEC**  
Every 20 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC ONCE\_AN\_MIN**  
Once of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_OFF**  
Scheduled Action - Turn Off

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_ON**  
Scheduled Action - Turn On

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_SCENE\_RECALL**  
Scheduled Action - Scene Recall

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_NO\_ACTION**  
Scheduled Action - No Action

**ESP\_BLE\_MESH\_SCHEDULE\_SCENE\_NO\_SCENE**  
Scheduled Scene - No Scene

**ESP\_BLE\_MESH\_SCHEDULE\_ENTRY\_MAX\_INDEX**  
Maximum number of Scheduled entries

**ESP\_BLE\_MESH\_TIME\_NONE**  
Time Role - None

**ESP\_BLE\_MESH\_TIME\_AUTHORITY**  
Time Role - Mesh Time Authority

**ESP\_BLE\_MESH\_TIME\_RELAY**  
Time Role - Mesh Time Relay

**ESP\_BLE\_MESH\_TIME\_CLINET**  
Time Role - Mesh Time Client

**ESP\_BLE\_MESH\_SCENE\_SUCCESS**  
Scene operation - Success

**ESP\_BLE\_MESH\_SCENE\_REG\_FULL**  
Scene operation - Scene Register Full

**ESP\_BLE\_MESH\_SCENE\_NOT\_FOUND**  
Scene operation - Scene Not Found

### Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t) (esp_ble_mesh_time_scene_client_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_client_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t) (esp_ble_mesh_time_scene_server_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_server_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

#### Parameters

- event: Event type

- param: Pointer to callback parameter

### Enumerations

**enum esp\_ble\_mesh\_time\_scene\_client\_cb\_event\_t**

This enum value is the event of Time Scene Client Model

*Values:*

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_EVT\_MAX**

**enum esp\_ble\_mesh\_time\_scene\_server\_cb\_event\_t**

This enum value is the event of Time Scene Server Model

*Values:*

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX**

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice: \* For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used. \* For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- [ESP32 Bluetooth Architecture \(PDF\) \[English\]](#)
- [ESP32 Bluetooth Architecture \(PDF\) \[中文\]](#)

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)
- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

## 2.2 Networking APIs

### 2.2.1 Wi-Fi

#### Wi-Fi

**Introduction** The WiFi libraries provide support for configuring and monitoring the ESP32 WiFi networking functionality. This includes configuration for:

- Station mode (aka STA mode or WiFi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Combined AP-STA mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 WiFi packets.

**Application Examples** The `wifi` directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the `wifi` directory of ESP-IDF examples.

In addition, there is a simple `esp-idf-template` application to demonstrate a minimal IDF project structure.

#### API Reference

##### Header File

- `esp_wifi/include/esp_wifi.h`

##### Functions

`esp_err_t esp_wifi_init (const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

##### Return

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

##### Parameters

- `config`: pointer to WiFi initialized configuration structure; can point to a temporary variable.

`esp_err_t esp_wifi_deinit (void)`

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

##### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_mode (wifi_mode_t mode)`

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error code in esp\_err.h

**Parameters**

- mode: WiFi operating mode

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] mode: store current WiFi mode

*esp\_err\_t* **esp\_wifi\_start** (void)

Start WiFi according to current configuration. If mode is WIFI\_MODE\_STA, it create station control block and start station. If mode is WIFI\_MODE\_AP, it create soft-AP control block and start soft-AP. If mode is WIFI\_MODE\_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_stop** (void)

Stop WiFi. If mode is WIFI\_MODE\_STA, it stop station and free station control block. If mode is WIFI\_MODE\_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI\_MODE\_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_connect** (void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_start\_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise

the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code `WIFI_REASON_NO_AP_FOUND`.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_ERR_WIFI_SSID`: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect` (void)

Disconnect the ESP32 WiFi station from the AP.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi was not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_FAIL`: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect` (void)

Currently this API is just an stub API.

**Return**

- `ESP_OK`: succeed
- others: fail

`esp_err_t esp_wifi_deauth_sta` (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

**Parameters**

- `aid`: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

`esp_err_t esp_wifi_scan_start` (const `wifi_scan_config_t` \*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in `esp_wifi_scan_get_ap_records`, so generally, call `esp_wifi_scan_get_ap_records` to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_WIFI_TIMEOUT`: blocking scan is timeout
- `ESP_ERR_WIFI_STATE`: wifi still connecting when invoke `esp_wifi_scan_start`
- others: refer to error code in `esp_err.h`

**Parameters**

- `config`: configuration of scanning
- `block`: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

`esp_err_t esp_wifi_scan_stop` (void)

Stop the scan in process.

**Return**

- `ESP_OK`: succeed

- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] number: store number of APIs found in last scan

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

**Parameters**

- [inout] number: As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- ap\_records: *wifi\_ap\_record\_t* array to hold the found APs

*esp\_err\_t* **esp\_wifi\_sta\_get\_ap\_info** (*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

**Parameters**

- ap\_info: the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_1r in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Return** ESP\_OK: succeed

**Parameters**

- type: power save type

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Return** ESP\_OK: succeed

**Parameters**

- [out] type: store current power save type

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_11AC)

**Attention** Currently we only support 802.11b or 802.11g or 802.11n mode

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interfaces
- protocol\_bitmap: WiFi protocol bitmap

*esp\_err\_t* **esp\_wifi\_get\_protocol** (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface
- [out] protocol\_bitmap: store current WiFi protocol bitmap of interface ifx

*esp\_err\_t* **esp\_wifi\_set\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface to be configured
- bw: bandwidth

*esp\_err\_t* **esp\_wifi\_get\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

*esp\_err\_t* **esp\_wifi\_set\_channel** (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp\_wifi\_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `primary`: for HT20, primary is the channel number, for HT40, primary is the primary channel
- `second`: for HT20, second is ignored, for HT40, second is the second channel

`esp_err_t esp_wifi_get_channel (uint8_t *primary, wifi_second_chan_t *second)`

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `primary`: store current primary channel
- `[out] second`: store current second channel

`esp_err_t esp_wifi_set_country (const wifi_country_t *country)`

configure country info

**Attention** 1. The default country is `{.cc=" CN" , .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}`

**Attention** 2. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc=" USA" , .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc=" JP" , .schan=1, .nchan=14}` then the country info that will be used is `{.cc=" JP" , .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back back to the country info of the station automatically, `{.cc=" US" , .schan=1, .nchan=11}` in the example.

**Attention** 3. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, always use the configured country info.

**Attention** 4. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is changed also.

**Attention** 5. The country configuration is not stored into flash

**Attention** 6. This API doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `country`: the configured country info

`esp_err_t esp_wifi_get_country (wifi_country_t *country)`

get the current country info

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `country`: country info

`esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])`

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX" , but can not be "15:XX:XX:XX:XX:XX" .

**Return**

- ESP\_OK: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- others: refer to error codes in `esp_err.h`

**Parameters**

- `ifx`: interface
- `mac`: the MAC address

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface

**Parameters**

- `ifx`: interface
- [out] `mac`: store mac of the interface ifx

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `cb`: callback

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `en`: false - disable, true - enable

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters**

- [out] `en`: store the current status of promiscuous mode

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except `WIFI_PKT_MISC`

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `filter`: the packet type filtered in promiscuous mode.

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of promiscuous filter

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- filter: the subtype of the control packet filtered in promiscuous mode.

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the erro code in esp\_err.h

**Parameters**

- interface: interface
- conf: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

**Parameters**

- interface: interface
- [out] conf: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_list** (*wifi\_sta\_list\_t* \*sta)

Get STAs associated with soft-AP.

**Attention** SSC only API

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- [out] sta: station list ap can get the connected sta's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_1r in the *wifi\_sta\_info\_t* struct. For example, phy\_11b = 1 imply that sta support 802.11b mode

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_aid**(const uint8\_t mac[6], uint16\_t \*aid)

Get AID of STA connected with soft-AP.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: Requested resource not found
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- mac: STA's mac address
- [out] aid: Store the AID corresponding to STA mac

*esp\_err\_t* **esp\_wifi\_set\_storage**(*wifi\_storage\_t* storage)

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI\_STORAGE\_FLASH

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- storage: : storage type

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie**(bool enable, *wifi\_vendor\_ie\_type\_t* type, *wifi\_vendor\_ie\_id\_t* idx, const void \*vnd\_ie)

Set 802.11 Vendor-Specific Information Element.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init()
- ESP\_ERR\_INVALID\_ARG: Invalid argument, including if first byte of vnd\_ie is not WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD) or second byte is an invalid length.
- ESP\_ERR\_NO\_MEM: Out of memory

**Parameters**

- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd\_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *vendor\_ie\_data\_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie\_cb**(*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- `cb`: Callback function
- `ctx`: Context argument, passed to callback function.

*esp\_err\_t* **esp\_wifi\_set\_max\_tx\_power** (*int8\_t power*)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the `max_tx_power` of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_START`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is out of range

**Parameters**

- `power`: Maximum WiFi transmitting power.

*esp\_err\_t* **esp\_wifi\_get\_max\_tx\_power** (*int8\_t \*power*)

Get maximum transmitting power after WiFi start.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_START`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `power`: Maximum WiFi transmitting power, unit is 0.25dBm.

*esp\_err\_t* **esp\_wifi\_set\_event\_mask** (*uint32\_t mask*)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRCVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `mask`: WiFi event mask.

*esp\_err\_t* **esp\_wifi\_get\_event\_mask** (*uint32\_t \*mask*)

Get mask of WiFi events.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `mask`: WiFi event mask.

*esp\_err\_t* **esp\_wifi\_80211\_tx** (*wifi\_interface\_t ifx*, **const** void \**buffer*, *int len*, *bool en\_sys\_seq*)

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**

- ESP\_OK: success
- ESP\_ERR\_WIFI\_IF: Invalid interface
- ESP\_ERR\_INVALID\_ARG: Invalid parameter
- ESP\_ERR\_WIFI\_NO\_MEM: out of memory

**Parameters**

- *ifx*: interface if the Wi-Fi mode is Station, the *ifx* should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the *ifx* should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the *ifx* should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the *ifx* is wrong, the API returns `ESP_ERR_WIFI_IF`.
- *buffer*: raw ieee80211 buffer
- *len*: the length of raw buffer, the *len* must be  $\leq 1500$  Bytes and  $\geq 24$  Bytes
- *en\_sys\_seq*: indicate whether use the internal sequence number. If *en\_sys\_seq* is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both *en\_sys\_seq*==true and *en\_sys\_seq*==false are fine. However, if the API is called after the Wi-Fi connection has been set up, *en\_sys\_seq* must be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

*esp\_err\_t* `esp_wifi_set_csi_rx_cb` (*wifi\_csi\_cb\_t* *cb*, void \**ctx*)

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- *cb*: callback
- *ctx*: context argument, passed to callback function

*esp\_err\_t* `esp_wifi_set_csi_config` (const *wifi\_csi\_config\_t* \**config*)

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- *config*: configuration

*esp\_err\_t* `esp_wifi_set_csi` (bool *en*)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- *en*: true - enable, false - disable

*esp\_err\_t* `esp_wifi_set_ant_gpio` (const *wifi\_ant\_gpio\_config\_t* \**config*)

Set antenna GPIO configuration.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

**Parameters**

- `config`: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)`

Get current antenna GPIO configuration.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is `NULL`

**Parameters**

- `config`: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)`

Set antenna configuration.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: Invalid argument, e.g. parameter is `NULL`, invalid antenna mode or invalid GPIO number

**Parameters**

- `config`: Antenna configuration.

`esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)`

Get current antenna configuration.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is `NULL`

**Parameters**

- `config`: Antenna configuration.

`esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)`

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force death the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument, For Station, if `sec` is less than 3. For SoftAP, if `sec` is less than 10.

**Parameters**

- `ifx`: interface to be configured.
- `sec`: Inactive time. Unit seconds.

`esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)`

Get inactive time of specified interface.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `ifx`: Interface to be configured.
- `sec`: Inactive time. Unit seconds.

*esp\_err\_t* **esp\_wifi\_status\_dump** (uint32\_t *modules*)

Dump WiFi statistics.

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- *modules*: statistic modules to be dumped

*esp\_err\_t* **esp\_wifi\_disable\_pmf\_config** (*wifi\_interface\_t* *ifx*)

Disable PMF configuration for specified interface.

**Attention** This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- *ifx*: Interface to be configured.

### Structures

**struct** **wifi\_init\_config\_t**

WiFi stack configuration parameters passed to `esp_wifi_init` call.

### Public Members

*system\_event\_handler\_t* **event\_handler**

WiFi event handler

*wifi\_osi\_funcs\_t* \***osi\_funcs**

WiFi OS functions

*wpa\_crypto\_funcs\_t* **wpa\_crypto\_funcs**

WiFi station crypto functions when connect

int **static\_rx\_buf\_num**

WiFi static RX buffer number

int **dynamic\_rx\_buf\_num**

WiFi dynamic RX buffer number

int **tx\_buf\_type**

WiFi TX buffer type

int **static\_tx\_buf\_num**

WiFi static TX buffer number

int **dynamic\_tx\_buf\_num**

WiFi dynamic TX buffer number

int **csi\_enable**

WiFi channel state information enable flag

int **ampdu\_rx\_enable**

WiFi AMPDU RX feature enable flag

int **ampdu\_tx\_enable**

WiFi AMPDU TX feature enable flag

int **nvs\_enable**

WiFi NVS flash enable flag

int **nano\_enable**

Nano option for printf/scan family enable flag

int **tx\_ba\_win**  
WiFi Block Ack TX window size

int **rx\_ba\_win**  
WiFi Block Ack RX window size

int **wifi\_task\_core\_id**  
WiFi Task Core ID

int **beacon\_max\_len**  
WiFi softAP maximum length of the beacon

int **mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64\_t **feature\_caps**  
Enables additional WiFi features and capabilities

int **magic**  
WiFi init magic number, it should be the last field

### Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**  
WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**  
WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**  
WiFi interface error

**ESP\_ERR\_WIFI\_MODE**  
WiFi mode error

**ESP\_ERR\_WIFI\_STATE**  
WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**  
WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**  
WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**  
MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**  
SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**  
Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**  
Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**  
WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**  
The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**  
Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

### Type Definitions

**typedef** void (\***wifi\_promiscuous\_cb\_t**) (void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

#### Parameters

- **buf**: Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.
- **type**: promiscuous packet type.

**typedef** void (\***esp\_vendor\_ie\_cb\_t**) (void \*ctx, *wifi\_vendor\_ie\_type\_t* type, **const** uint8\_t sa[6], **const** *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

#### Parameters

- **ctx**: Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- **type**: Information element type, based on frame type received.
- **sa**: Source 802.11 address.
- **vnd\_ie**: Pointer to the vendor specific element data received.
- **rssi**: Received signal strength indication.

**typedef** void (\***wifi\_csi\_cb\_t**) (void \*ctx, *wifi\_csi\_info\_t* \*data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

#### Parameters

- **ctx**: context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.
- **data**: CSI data received. The memory that it points to will be deallocated after callback function returns.

## Header File

- `esp_wifi/include/esp_wifi_types.h`

## Unions

### **union wifi\_config\_t**

*#include <esp\_wifi\_types.h>* Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**  
configuration of AP

*wifi\_sta\_config\_t* **sta**  
configuration of STA

## Structures

### **struct wifi\_country\_t**

Structure describing WiFi country-based regional restrictions.

### Public Members

char **cc**[3]  
country code string

uint8\_t **schan**  
start channel

uint8\_t **nchan**  
total channel number

int8\_t **max\_tx\_power**  
This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**  
country policy

### **struct wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

### Public Members

uint32\_t **min**  
minimum active scan time per channel, units: millisecond

uint32\_t **max**  
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

### **struct wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

### Public Members

*wifi\_active\_scan\_time\_t* **active**

active scan time per channel, units: millisecond.

uint32\_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi\_scan\_config\_t**

Parameters for an SSID scan.

### Public Members

uint8\_t \***ssid**

SSID of AP

uint8\_t \***bssid**

MAC address of AP

uint8\_t **channel**

channel, scan the specific channel

bool **show\_hidden**

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

**struct wifi\_ap\_record\_t**

Description of a WiFi AP.

### Public Members

uint8\_t **bssid**[6]

MAC address of AP

uint8\_t **ssid**[33]

SSID of AP

uint8\_t **primary**

channel of AP

*wifi\_second\_chan\_t* **second**

secondary channel of AP

int8\_t **rssi**

signal strength of AP

*wifi\_auth\_mode\_t* **authmode**

authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

group cipher of AP

*wifi\_ant\_t* **ant**

antenna used to receive beacon from AP

uint32\_t **phy\_11b** : 1  
bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g** : 1  
bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n** : 1  
bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr** : 1  
bit: 3 flag to identify if low rate is enabled or not

uint32\_t **wps** : 1  
bit: 4 flag to identify if WPS is supported or not

uint32\_t **reserved** : 27  
bit: 5..31 reserved

*wifi\_country\_t* **country**  
country information of AP

**struct wifi\_scan\_threshold\_t**  
Structure describing parameters for a WiFi fast scan.

### Public Members

int8\_t **rssi**  
The minimum rssi to accept in the fast scan mode

*wifi\_auth\_mode\_t* **authmode**  
The weakest authmode to accept in the fast scan mode

**struct wifi\_pmf\_config\_t**  
Configuration structure for Protected Management Frame

### Public Members

bool **capable**  
Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**  
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi\_ap\_config\_t**  
Soft-AP configuration settings for the ESP32.

### Public Members

uint8\_t **ssid**[32]  
SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

uint8\_t **password**[64]  
Password of ESP32 soft-AP.

uint8\_t **ssid\_len**  
Optional length of SSID field.

uint8\_t **channel**  
Channel of ESP32 soft-AP

**wifi\_auth\_mode\_t authmode**

Auth mode of ESP32 soft-AP. Do not support AUTH\_WEP in soft-AP mode

**uint8\_t ssid\_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

**uint8\_t max\_connection**

Max number of stations allowed to connect in, default 4, max 10

**uint16\_t beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**struct wifi\_sta\_config\_t**

STA configuration settings for the ESP32.

**Public Members****uint8\_t ssid[32]**

SSID of target AP.

**uint8\_t password[64]**

Password of target AP.

**wifi\_scan\_method\_t scan\_method**

do all channel scan or fast scan

**bool bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**uint8\_t bssid[6]**

MAC address of target AP

**uint8\_t channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16\_t listen\_interval**

Listen interval for ESP32 station to receive beacon when WIFI\_PS\_MAX\_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi\_sort\_method\_t sort\_method**

sort the connect AP in the list by rssi or security mode

**wifi\_scan\_threshold\_t threshold**

When sort\_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi\_pmf\_config\_t pmf\_cfg**

Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

**struct wifi\_sta\_info\_t**

Description of STA associated with AP.

**Public Members****uint8\_t mac[6]**

mac address

**int8\_t rssi**

current average rssi of sta connected

**uint32\_t phy\_11b : 1**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g** : 1  
bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n** : 1  
bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr** : 1  
bit: 3 flag to identify if low rate is enabled or not

uint32\_t **reserved** : 28  
bit: 4..31 reserved

### **struct wifi\_sta\_list\_t**

List of stations associated with the ESP32 Soft-AP.

#### **Public Members**

*wifi\_sta\_info\_t* **sta**[ESP\_WIFI\_MAX\_CONN\_NUM]  
station list

int **num**  
number of stations in the list (other entries are invalid)

### **struct vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

#### **Public Members**

uint8\_t **element\_id**  
Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**  
Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]  
Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**  
Vendor-specific OUI type.

uint8\_t **payload**[0]  
Payload. Length is equal to value in 'length' field, minus 4.

### **struct wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

#### **Public Members**

signed **rssi** : 8  
Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate** : 5  
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_** : 1  
reserve

unsigned **sig\_mode** : 2  
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_** : 16  
reserve

unsigned **mcs** : 7  
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb** : 1  
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_** : 16  
reserve

unsigned **smoothing** : 1  
reserve

unsigned **not\_sounding** : 1  
reserve

unsigned **\_\_pad3\_\_** : 1  
reserve

unsigned **aggregation** : 1  
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc** : 2  
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding** : 1  
Flag is set for 11n packets which are LDPC

unsigned **sgi** : 1  
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed **noise\_floor** : 8  
noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned **ampdu\_cnt** : 8  
ampdu cnt

unsigned **channel** : 4  
primary channel on which this packet is received

unsigned **secondary\_channel** : 4  
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad4\_\_** : 8  
reserve

unsigned **timestamp** : 32  
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad5\_\_** : 32  
reserve

unsigned **\_\_pad6\_\_** : 31  
reserve

unsigned **ant** : 1  
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig\_len** : 12  
length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad7\_\_** : 12  
reserve

unsigned **rx\_state** : 8  
state of the packet. 0: no error; others: error numbers which are not public

**struct wifi\_promiscuous\_pkt\_t**  
Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**  
metadata header

uint8\_t **payload**[0]  
Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

**struct wifi\_promiscuous\_filter\_t**  
Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**  
OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

**struct wifi\_csi\_config\_t**  
Channel state information(CSI) configuration type.

### Public Members

bool **lltf\_en**  
enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf\_en**  
enable to receive HT long training field(htltf) data. Default enabled

bool **stbc\_htltf2\_en**  
enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf\_merge\_en**  
enable to generate htltf data by averaging lltf and ht\_ltf data when receiving HT packet. Otherwise, use ht\_ltf data directly. Default enabled

bool **channel\_filter\_en**  
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**  
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**  
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi\_csi\_info\_t**  
CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**  
received packet radio metadata header of the CSI data

`uint8_t mac[6]`  
source MAC address of the CSI data

`bool first_word_invalid`  
first four bytes of the CSI data is invalid or not

`int8_t *buf`  
buffer of CSI data

`uint16_t len`  
length of CSI data

**struct wifi\_ant\_gpio\_t**  
WiFi GPIO configuration for antenna selection.

### Public Members

`uint8_t gpio_select : 1`  
Whether this GPIO is connected to external antenna switch

`uint8_t gpio_num : 7`  
The GPIO number that connects to external antenna switch

**struct wifi\_ant\_gpio\_config\_t**  
WiFi GPIOs configuration for antenna selection.

### Public Members

`wifi_ant_gpio_t gpio_cfg[4]`  
The configurations of GPIOs that connect to external antenna switch

**struct wifi\_ant\_config\_t**  
WiFi antenna configuration.

### Public Members

`wifi_ant_mode_t rx_ant_mode`  
WiFi antenna mode for receiving

`wifi_ant_t rx_ant_default`  
Default antenna mode for receiving, it's ignored if `rx_ant_mode` is not `WIFI_ANT_MODE_AUTO`

`wifi_ant_mode_t tx_ant_mode`  
WiFi antenna mode for transmission, it can be set to `WIFI_ANT_MODE_AUTO` only if `rx_ant_mode` is set to `WIFI_ANT_MODE_AUTO`

`uint8_t enabled_ant0 : 4`  
Index (in antenna GPIO configuration) of enabled `WIFI_ANT_MODE_ANT0`

`uint8_t enabled_ant1 : 4`  
Index (in antenna GPIO configuration) of enabled `WIFI_ANT_MODE_ANT1`

**struct wifi\_event\_sta\_scan\_done\_t**  
Argument structure for `WIFI_EVENT_SCAN_DONE` event

### Public Members

`uint32_t status`  
status of scanning APs: 0 — success, 1 - failure

`uint8_t number`  
number of scan results

`uint8_t scan_id`  
scan sequence number, used for block scan

**struct `wifi_event_sta_connected_t`**  
Argument structure for `WIFI_EVENT_STA_CONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of connected AP

`uint8_t ssid_len`  
SSID length of connected AP

`uint8_t bssid[6]`  
BSSID of connected AP

`uint8_t channel`  
channel of connected AP

`wifi_auth_mode_t authmode`  
authentication mode used by AP

**struct `wifi_event_sta_disconnected_t`**  
Argument structure for `WIFI_EVENT_STA_DISCONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of disconnected AP

`uint8_t ssid_len`  
SSID length of disconnected AP

`uint8_t bssid[6]`  
BSSID of disconnected AP

`uint8_t reason`  
reason of disconnection

**struct `wifi_event_sta_authmode_change_t`**  
Argument structure for `WIFI_EVENT_STA_AUTHMODE_CHANGE` event

### Public Members

`wifi_auth_mode_t old_mode`  
the old auth mode of AP

`wifi_auth_mode_t new_mode`  
the new auth mode of AP

**struct `wifi_event_sta_wps_er_pin_t`**  
Argument structure for `WIFI_EVENT_STA_WPS_ER_PIN` event

### Public Members

`uint8_t pin_code[8]`  
PIN code of station in enrollee mode

**struct `wifi_event_sta_wps_er_success_t`**  
Argument structure for `WIFI_EVENT_STA_WPS_ER_SUCCESS` event

**Public Members****uint8\_t ap\_cred\_cnt**

Number of AP credentials received

**uint8\_t ssid[MAX\_SSID\_LEN]**

SSID of AP

**uint8\_t passphrase[MAX\_PASSPHRASE\_LEN]**

Passphrase for the AP

**struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] ap\_cred[MAX\_WPS\_AP\_CRED]**

All AP credentials received from WPS handshake

**struct *wifi\_event\_ap\_staconnected\_t***

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members****uint8\_t mac[6]**

MAC address of the station connected to ESP32 soft-AP

**uint8\_t aid**

the aid that ESP32 soft-AP gives to the station connected to

**struct *wifi\_event\_ap\_stadisconnected\_t***

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

**Public Members****uint8\_t mac[6]**

MAC address of the station disconnects to ESP32 soft-AP

**uint8\_t aid**

the aid that ESP32 soft-AP gave to the station disconnects to

**struct *wifi\_event\_ap\_probe\_req\_rx\_t***

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

**Public Members****int rssi**

Received probe request signal strength

**uint8\_t mac[6]**

MAC address of the station which send probe request

**Macros****WIFI\_IF\_STA****WIFI\_IF\_AP****WIFI\_PROTOCOL\_11B****WIFI\_PROTOCOL\_11G****WIFI\_PROTOCOL\_11N****WIFI\_PROTOCOL\_LR****ESP\_WIFI\_MAX\_CONN\_NUM**

max number of stations which can connect to ESP32 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**  
filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**  
filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**  
filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**  
filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**  
filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**  
filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**  
filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**  
filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**  
filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**  
filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**  
filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**  
filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**  
filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**  
filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**  
filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**  
filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**  
filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**  
filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**  
mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**  
mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**  
mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATUS\_RXTX**

**WIFI\_STATUS\_HW**

**WIFI\_STATUS\_DIAG**

**WIFI\_STATUS\_ALL**

### Type Definitions

```
typedef esp_interface_t wifi_interface_t
```

### Enumerations

```
enum wifi_mode_t
```

*Values:*

**WIFI\_MODE\_NULL** = 0  
null mode

**WIFI\_MODE\_STA**  
WiFi station mode

**WIFI\_MODE\_AP**  
WiFi soft-AP mode

**WIFI\_MODE\_APSTA**  
WiFi station + soft-AP mode

**WIFI\_MODE\_MAX**

```
enum wifi_country_policy_t
```

*Values:*

**WIFI\_COUNTRY\_POLICY\_AUTO**  
Country policy is auto, use the country info of AP to which the station is connected

**WIFI\_COUNTRY\_POLICY\_MANUAL**  
Country policy is manual, always use the configured country info

```
enum wifi_auth_mode_t
```

*Values:*

**WIFI\_AUTH\_OPEN** = 0  
authenticate mode : open

**WIFI\_AUTH\_WEP**  
authenticate mode : WEP

**WIFI\_AUTH\_WPA\_PSK**  
authenticate mode : WPA\_PSK

**WIFI\_AUTH\_WPA2\_PSK**  
authenticate mode : WPA2\_PSK

**WIFI\_AUTH\_WPA\_WPA2\_PSK**  
authenticate mode : WPA\_WPA2\_PSK

**WIFI\_AUTH\_WPA2\_ENTERPRISE**  
authenticate mode : WPA2\_ENTERPRISE

**WIFI\_AUTH\_WPA3\_PSK**  
authenticate mode : WPA3\_PSK

**WIFI\_AUTH\_WPA2\_WPA3\_PSK**  
authenticate mode : WPA2\_WPA3\_PSK

**WIFI\_AUTH\_MAX**

**enum wifi\_err\_reason\_t***Values:*

```
WIFI_REASON_UNSPECIFIED = 1
WIFI_REASON_AUTH_EXPIRE = 2
WIFI_REASON_AUTH_LEAVE = 3
WIFI_REASON_ASSOC_EXPIRE = 4
WIFI_REASON_ASSOC_TOOMANY = 5
WIFI_REASON_NOT_AUTHED = 6
WIFI_REASON_NOT_ASSOCED = 7
WIFI_REASON_ASSOC_LEAVE = 8
WIFI_REASON_ASSOC_NOT_AUTHED = 9
WIFI_REASON_DISASSOC_PWRCAP_BAD = 10
WIFI_REASON_DISASSOC_SUPCHAN_BAD = 11
WIFI_REASON_IE_INVALID = 13
WIFI_REASON_MIC_FAILURE = 14
WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT = 15
WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT = 16
WIFI_REASON_IE_IN_4WAY_DIFFERS = 17
WIFI_REASON_GROUP_CIPHER_INVALID = 18
WIFI_REASON_PAIRWISE_CIPHER_INVALID = 19
WIFI_REASON_AKMP_INVALID = 20
WIFI_REASON_UNSUPP_RSN_IE_VERSION = 21
WIFI_REASON_INVALID_RSN_IE_CAP = 22
WIFI_REASON_802_1X_AUTH_FAILED = 23
WIFI_REASON_CIPHER_SUITE_REJECTED = 24
WIFI_REASON_INVALID_PMKID = 53
WIFI_REASON_BEACON_TIMEOUT = 200
WIFI_REASON_NO_AP_FOUND = 201
WIFI_REASON_AUTH_FAIL = 202
WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
```

**enum wifi\_second\_chan\_t***Values:*

```
WIFI_SECOND_CHAN_NONE = 0
    the channel width is HT20
WIFI_SECOND_CHAN_ABOVE
    the channel width is HT40 and the secondary channel is above the primary channel
WIFI_SECOND_CHAN_BELOW
    the channel width is HT40 and the secondary channel is below the primary channel
```

**enum wifi\_scan\_type\_t***Values:*

- WIFI\_SCAN\_TYPE\_ACTIVE** = 0  
active scan
- WIFI\_SCAN\_TYPE\_PASSIVE**  
passive scan

**enum wifi\_cipher\_type\_t***Values:*

- WIFI\_CIPHER\_TYPE\_NONE** = 0  
the cipher type is none
- WIFI\_CIPHER\_TYPE\_WEP40**  
the cipher type is WEP40
- WIFI\_CIPHER\_TYPE\_WEP104**  
the cipher type is WEP104
- WIFI\_CIPHER\_TYPE\_TKIP**  
the cipher type is TKIP
- WIFI\_CIPHER\_TYPE\_CCMP**  
the cipher type is CCMP
- WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**  
the cipher type is TKIP and CCMP
- WIFI\_CIPHER\_TYPE\_AES\_CMAC128**  
the cipher type is AES-CMAC-128
- WIFI\_CIPHER\_TYPE\_UNKNOWN**  
the cipher type is unknown

**enum wifi\_ant\_t**

WiFi antenna.

*Values:*

- WIFI\_ANT\_ANT0**  
WiFi antenna 0
- WIFI\_ANT\_ANT1**  
WiFi antenna 1
- WIFI\_ANT\_MAX**  
Invalid WiFi antenna

**enum wifi\_scan\_method\_t***Values:*

- WIFI\_FAST\_SCAN** = 0  
Do fast scan, scan will end after find SSID match AP
- WIFI\_ALL\_CHANNEL\_SCAN**  
All channel scan, scan will end after scan all the channel

**enum wifi\_sort\_method\_t***Values:*

- WIFI\_CONNECT\_AP\_BY\_SIGNAL** = 0  
Sort match AP in scan list by RSSI
- WIFI\_CONNECT\_AP\_BY\_SECURITY**  
Sort match AP in scan list by security mode

**enum wifi\_ps\_type\_t***Values:*

**WIFI\_PS\_NONE**

No power save

**WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

**WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)

**enum wifi\_bandwidth\_t**

Values:

**WIFI\_BW\_HT20** = 1

**WIFI\_BW\_HT40**

**enum wifi\_storage\_t**

Values:

**WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

**WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

**enum wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

**WIFI\_VND\_IE\_TYPE\_BEACON**

**WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

**WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

**WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

**WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

**enum wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

**WIFI\_VND\_IE\_ID\_0**

**WIFI\_VND\_IE\_ID\_1**

**enum wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

**WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is [wifi\\_promiscuous\\_pkt\\_t](#)

**WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is [wifi\\_promiscuous\\_pkt\\_t](#)

**WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is [wifi\\_promiscuous\\_pkt\\_t](#)

**WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is [wifi\\_promiscuous\\_pkt\\_t](#) but the payload is zero length.

**enum wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:***WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

**WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

**WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

**WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

**enum wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:***WIFI\_PHY\_RATE\_1M\_L = 0x00**

1 Mbps with long preamble

**WIFI\_PHY\_RATE\_2M\_L = 0x01**

2 Mbps with long preamble

**WIFI\_PHY\_RATE\_5M\_L = 0x02**

5.5 Mbps with long preamble

**WIFI\_PHY\_RATE\_11M\_L = 0x03**

11 Mbps with long preamble

**WIFI\_PHY\_RATE\_2M\_S = 0x05**

2 Mbps with short preamble

**WIFI\_PHY\_RATE\_5M\_S = 0x06**

5.5 Mbps with short preamble

**WIFI\_PHY\_RATE\_11M\_S = 0x07**

11 Mbps with short preamble

**WIFI\_PHY\_RATE\_48M = 0x08**

48 Mbps

**WIFI\_PHY\_RATE\_24M = 0x09**

24 Mbps

**WIFI\_PHY\_RATE\_12M = 0x0A**

12 Mbps

**WIFI\_PHY\_RATE\_6M = 0x0B**

6 Mbps

**WIFI\_PHY\_RATE\_54M = 0x0C**

54 Mbps

**WIFI\_PHY\_RATE\_36M = 0x0D**

36 Mbps

**WIFI\_PHY\_RATE\_18M = 0x0E**

18 Mbps

**WIFI\_PHY\_RATE\_9M = 0x0F**

9 Mbps

**WIFI\_PHY\_RATE\_MCS0\_LGI = 0x10**

MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS1\_LGI** = 0x11  
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS2\_LGI** = 0x12  
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS3\_LGI** = 0x13  
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS4\_LGI** = 0x14  
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS5\_LGI** = 0x15  
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS6\_LGI** = 0x16  
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS7\_LGI** = 0x17  
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS0\_SGI** = 0x18  
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS1\_SGI** = 0x19  
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS2\_SGI** = 0x1A  
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS3\_SGI** = 0x1B  
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS4\_SGI** = 0x1C  
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS5\_SGI** = 0x1D  
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS6\_SGI** = 0x1E  
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS7\_SGI** = 0x1F  
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

**WIFI\_PHY\_RATE\_LORA\_250K** = 0x29  
250 Kbps

**WIFI\_PHY\_RATE\_LORA\_500K** = 0x2A  
500 Kbps

**WIFI\_PHY\_RATE\_MAX**

**enum wifi\_event\_t**

WiFi event declarations

*Values:*

**WIFI\_EVENT\_WIFI\_READY** = 0  
ESP32 WiFi ready

**WIFI\_EVENT\_SCAN\_DONE**  
ESP32 finish scanning AP

**WIFI\_EVENT\_STA\_START**  
ESP32 station start

**WIFI\_EVENT\_STA\_STOP**  
ESP32 station stop

**WIFI\_EVENT\_STA\_CONNECTED**

ESP32 station connected to AP

**WIFI\_EVENT\_STA\_DISCONNECTED**

ESP32 station disconnected from AP

**WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by ESP32 station changed

**WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

ESP32 station beacon timeout

**WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

ESP32 station wps succeeds in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

ESP32 station wps fails in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

ESP32 station wps timeout in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

ESP32 station wps pin code in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

ESP32 station wps overlap in enrollee mode

**WIFI\_EVENT\_AP\_START**

ESP32 soft-AP start

**WIFI\_EVENT\_AP\_STOP**

ESP32 soft-AP stop

**WIFI\_EVENT\_AP\_STA\_CONNECTED**

a station connected to ESP32 soft-AP

**WIFI\_EVENT\_AP\_STADISCONNECTED**

a station disconnected from ESP32 soft-AP

**WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

**WIFI\_EVENT\_MAX**

Invalid WiFi event ID

**enum wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

**WPS\_FAIL\_REASON\_NORMAL = 0**

ESP32 WPS normal fail reason

**WPS\_FAIL\_REASON\_RECV\_M2D**

ESP32 WPS receive M2D frame

**WPS\_FAIL\_REASON\_MAX**

## SmartConfig

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_smartconfig.h](#)

## Functions

**const** char \***esp\_smartconfig\_get\_version** (void)

Get the version of SmartConfig.

### Return

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (**const** *smartconfig\_start\_config\_t* \**config*)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

### Return

- ESP\_OK: succeed
- others: fail

### Parameters

- *config*: pointer to smartconfig start configure structure

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

### Return

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t *time\_s*)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

### Return

- ESP\_OK: succeed
- others: fail

### Parameters

- *time\_s*: range 15s~255s, offset:45s.

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* *type*)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

### Return

- ESP\_OK: succeed
- others: fail

### Parameters

- *type*: Choose from the `smartconfig_type_t`.

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool *enable*)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

### Return

- ESP\_OK: succeed
- others: fail

### Parameters

- *enable*: false-disable(default); true-enable;

## Structures

**struct** **smartconfig\_event\_got\_ssid\_pswd\_t**

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

`uint8_t ssid[32]`  
SSID of the AP. Null terminated string.

`uint8_t password[64]`  
Password of the AP. Null terminated string.

`bool bssid_set`  
whether set MAC address of target AP or not.

`uint8_t bssid[6]`  
MAC address of target AP.

`smartconfig_type_t type`  
Type of smartconfig(ESPTouch or AirKiss).

`uint8_t token`  
Token from cellphone which is used to send ACK to cellphone.

`uint8_t cellphone_ip[4]`  
IP address of cellphone.

`struct smartconfig_start_config_t`  
Configure structure for esp\_smartconfig\_start

### Public Members

`bool enable_log`  
Enable smartconfig logs.

### Macros

`SMARTCONFIG_START_CONFIG_DEFAULT()`

### Enumerations

`enum smartconfig_type_t`

*Values:*

`SC_TYPE_ESPTOUCH = 0`  
protocol: ESPTouch

`SC_TYPE_AIRKISS`  
protocol: AirKiss

`SC_TYPE_ESPTOUCH_AIRKISS`  
protocol: ESPTouch and AirKiss

`enum smartconfig_event_t`

Smartconfig event declarations

*Values:*

`SC_EVENT_SCAN_DONE`  
ESP32 station smartconfig has finished to scan for APs

`SC_EVENT_FOUND_CHANNEL`  
ESP32 station smartconfig has found the channel of the target AP

`SC_EVENT_GOT_SSID_PSWD`  
ESP32 station smartconfig got the SSID and password

`SC_EVENT_SEND_ACK_DONE`  
ESP32 station smartconfig has sent ACK to cellphone

## ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

-----									
↔	-----								
	MAC Header		Category Code		Organization Identifier		Random Values		Vendor-
↔	Specific Content			FCS		-----			
↔	-----								
	24 bytes		1 byte		3 bytes		4 bytes		7~
↔	255 bytes		4 bytes	-----					

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

-----												
	Element ID		Length		Organization Identifier		Type		Version		Body	
-----												
	1 byte		1 byte		3 bytes		1 byte		1 byte		0~250 bytes	
-----												

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

## Security

**ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.**

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_now.h](#)

### Functions

`esp_err_t esp_now_init (void)`  
Initialize ESPNOW function.

#### Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_INTERNAL` : Internal error

`esp_err_t esp_now_deinit (void)`  
De-initialize ESPNOW function.

#### Return

- `ESP_OK` : succeed

`esp_err_t esp_now_get_version (uint32_t *version)`  
Get the version of ESPNOW.

#### Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_ARG` : invalid argument

#### Parameters

- `version`: ESPNOW version

`esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)`  
Register callback function of receiving ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

**Parameters**

- cb: callback function of receiving ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_recv\_cb** (void)

Unregister callback function of receiving ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* cb)

Register callback function of sending ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

**Parameters**

- cb: callback function of sending ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (**const** uint8\_t \**peer\_addr*, **const** uint8\_t \**data*, size\_t *len*)

Send ESPNOW data.

**Attention** 1. If *peer\_addr* is not NULL, send data to the peer whose MAC address matches *peer\_addr*

**Attention** 2. If *peer\_addr* is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than ESP\_NOW\_MAX\_DATA\_LEN

**Attention** 4. The buffer pointed to by data argument does not need to be valid after *esp\_now\_send* returns

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found
- ESP\_ERR\_ESPNOW\_IF : current WiFi interface doesn't match that of peer

**Parameters**

- *peer\_addr*: peer MAC address
- *data*: data to send
- *len*: length of data

*esp\_err\_t* **esp\_now\_add\_peer** (**const** *esp\_now\_peer\_info\_t* \**peer*)

Add a peer to peer list.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory
- ESP\_ERR\_ESPNOW\_EXIST : peer has existed

**Parameters**

- *peer*: peer information

*esp\_err\_t* **esp\_now\_del\_peer** (*const uint8\_t \*peer\_addr*)

Delete a peer from peer list.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

**Parameters**

- peer\_addr: peer MAC address

*esp\_err\_t* **esp\_now\_mod\_peer** (*const esp\_now\_peer\_info\_t \*peer*)

Modify a peer.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full

**Parameters**

- peer: peer information

*esp\_err\_t* **esp\_now\_get\_peer** (*const uint8\_t \*peer\_addr, esp\_now\_peer\_info\_t \*peer*)

Get a peer whose MAC address matches peer\_addr from peer list.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

**Parameters**

- peer\_addr: peer MAC address
- peer: peer information

*esp\_err\_t* **esp\_now\_fetch\_peer** (*bool from\_head, esp\_now\_peer\_info\_t \*peer*)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

**Parameters**

- from\_head: fetch from head of list or not
- peer: peer information

bool **esp\_now\_is\_peer\_exist** (*const uint8\_t \*peer\_addr*)

Peer exists or not.

**Return**

- true : peer exists
- false : peer not exists

**Parameters**

- peer\_addr: peer MAC address

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t \*num*)

Get the number of peers.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

**Parameters**

- num: number of peers

*esp\_err\_t* **esp\_now\_set\_pmk** (*const* uint8\_t \**pmk*)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

**Parameters**

- pmk: primary master key

## Structures

**struct esp\_now\_peer\_info**

ESPNOW peer information parameters.

### Public Members

uint8\_t **peer\_addr**[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

**struct esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

## Macros

**ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**  
ESPNow peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**  
ESPNow peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**  
Internal error

**ESP\_ERR\_ESPNOW\_EXIST**  
ESPNow peer has existed

**ESP\_ERR\_ESPNOW\_IF**  
Interface error

**ESP\_NOW\_ETH\_ALEN**  
Length of ESPNow peer MAC address

**ESP\_NOW\_KEY\_LEN**  
Length of ESPNow peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**  
Maximum number of ESPNow total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**  
Maximum number of ESPNow encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**  
Maximum length of ESPNow data which is sent very time

### Type Definitions

```
typedef struct esp_now_peer_info esp_now_peer_info_t
    ESPNow peer information parameters.
typedef struct esp_now_peer_num esp_now_peer_num_t
    Number of ESPNow peers which exist currently.
typedef void (*esp_now_recv_cb_t) (const uint8_t *mac_addr, const uint8_t *data, int
                                   data_len)
    Callback function of receiving ESPNow data.
```

#### Parameters

- *mac\_addr*: peer MAC address
- *data*: received data
- *data\_len*: length of received data

```
typedef void (*esp_now_send_cb_t) (const uint8_t *mac_addr, esp_now_send_status_t status)
    Callback function of sending ESPNow data.
```

#### Parameters

- *mac\_addr*: peer MAC address
- *status*: status of sending ESPNow data (succeed or fail)

### Enumerations

```
enum esp_now_send_status_t
    Status of sending ESPNow data .
```

*Values:*

```
ESP_NOW_SEND_SUCCESS = 0
    Send ESPNow data successfully
```

```
ESP_NOW_SEND_FAIL
    Send ESPNow data fail
```

### ESP-MESH Programming Guide

This is a programming guide for ESP-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. [ESP-MESH Programming Model](#)
2. [Writing an ESP-MESH Application](#)
3. [Self Organized Networking](#)
4. [Application Examples](#)
5. [API Reference](#)

For documentation regarding the ESP-MESH protocol, please see the [ESP-MESH API Guide](#). For more information about ESP-MESH Development Framework, please see [ESP-MESH Development Framework](#).

### ESP-MESH Programming Model

**Software Stack** The ESP-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-MESH software stack.

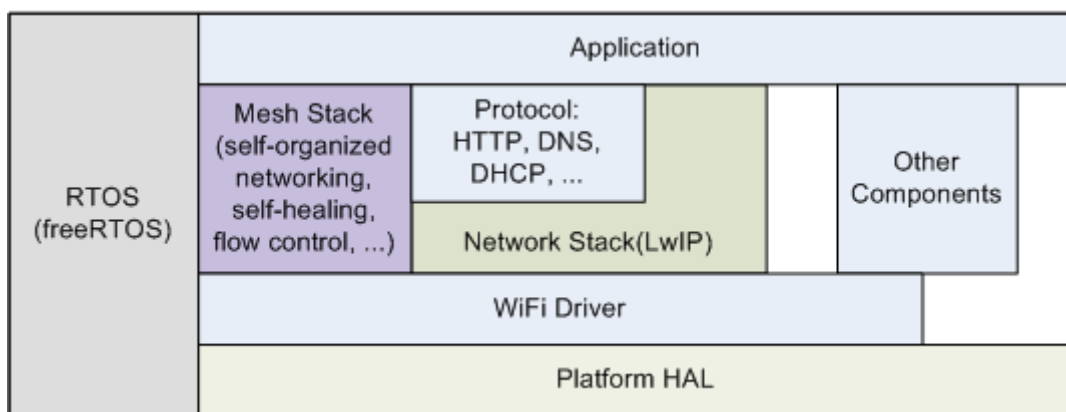

Fig. 2: ESP-MESH Software Stack

**System Events** An application interfaces with ESP-MESH via **ESP-MESH Events**. Since ESP-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-MESH application.

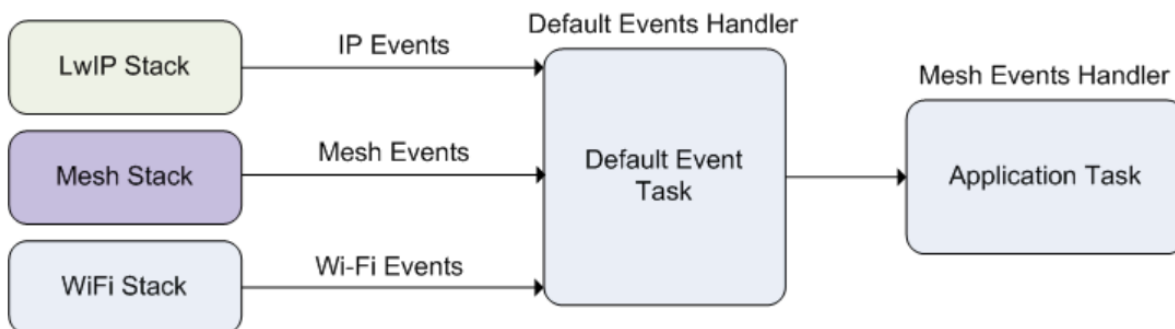

Fig. 3: ESP-MESH System Events Delivery

The `mesh_event_id_t` defines all possible ESP-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-MESH's self-organizing behavior.** Therefore, user's should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-MESH** The application can access the ESP-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node is required to initialize LwIP by calling `tcpip_adapter_init()`.** In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-MESH applications.

```
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-MESH Application** The prerequisites for starting ESP-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-MESH itself can be initialized.

```
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
```

(continues on next page)

(continued from previous page)

```
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-MESH network up and running can be summarized into the following three steps:

1. *Initialize Mesh*
2. *Configuring an ESP-MESH Network*
3. *Start Mesh*

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-MESH

```
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));
```

**Configuring an ESP-MESH Network** ESP-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-MESH Network, see <code>mesh_addr_t</code>
Router	Router Configuration, see <code>mesh_router_t</code>
Mesh AP	Mesh AP Configuration, see <code>mesh_ap_cfg_t</code>
Crypto Functions	Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code>

The following code snippet demonstrates how to configure ESP-MESH.

```
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
      strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
      strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

**Start Mesh** The following code snippet demonstrates how to start ESP-MESH.

```
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-MESH, the application should check for ESP-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self Organized Networking** Self organized networking is a feature of ESP-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self organized networking is enabled, the ESP-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-MESH.**

**Toggling Self Organized Networking** Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking** The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking** ESP-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> <li>• Nodes already connected to a parent node will remain connected.</li> <li>• Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• A root node already connected to router will stay connected.</li> <li>• A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.</li> </ul>
Y	N	<ul style="list-style-type: none"> <li>• Nodes without a parent node will automatically select a preferred parent and connect.</li> <li>• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• For a root node to connect to a parent node, it must give up it's role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.</li> </ul>

The following code snipping demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-MESH.

```
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

**Application Examples** ESP-IDF contains these ESP-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_mesh.h](#)

### Functions

*esp\_err\_t* **esp\_mesh\_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

#### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

#### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.

**Return**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

**Parameters**

- [in] to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- [in] data: pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.

- Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
- Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- [in] flag: bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ( “to” parameter isn’ t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-blocking, MESH\_DATA\_NONBLOCK should be set. Otherwise, may use esp\_mesh\_send\_block\_time() to specify a blocking time.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by esp\_mesh\_rcv\_toDS(). Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- [in] opt: options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- [in] opt\_count: option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

*esp\_err\_t* **esp\_mesh\_send\_block\_time** (uint32\_t *time\_ms*)

Set blocking time of esp\_mesh\_send()

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK

**Parameters**

- [in] *time\_ms*: blocking time of esp\_mesh\_send(), unit:ms

*esp\_err\_t* **esp\_mesh\_rcv** (*mesh\_addr\_t* \**from*, *mesh\_data\_t* \**data*, int *timeout\_ms*, int \**flag*, *mesh\_opt\_t* *opt*[], int *opt\_count*)

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp\_mesh\_get\_rx\_pending() to check the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

**Parameters**

- [out] *from*: the address of the original source of the packet
- [out] *data*: pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- [in] *timeout\_ms*: wait time if a packet isn’ t immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] *flag*: bitmap for data received

- MESH\_DATA\_FROMDS represents data from external IP network
- MESH\_DATA\_TODS represents data directed upward within the mesh network

**Parameters**

- [out] *opt*: options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- [in] *opt\_count*: option count desired to receive
  - Currently, this API only takes one option, so *opt\_count* is only supported to be 1.

*esp\_err\_t* **esp\_mesh\_recv\_toDS** (*mesh\_addr\_t* \**from*, *mesh\_addr\_t* \**to*, *mesh\_data\_t* \**data*, int *timeout\_ms*, int \**flag*, *mesh\_opt\_t* *opt*[], int *opt\_count*)

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

*flag* could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

**Parameters**

- [out] *from*: the address of the original source of the packet
- [out] *to*: the address contains remote IP address and port (IPv4:PORT)
- [out] *data*: pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- [in] *timeout\_ms*: wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] *flag*: bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

**Parameters**

- [out] *opt*: options desired to receive
- [in] *opt\_count*: option count desired to receive

*esp\_err\_t* **esp\_mesh\_set\_config** (const *mesh\_cfg\_t* \**config*)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] `config`: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_get\_config** (*mesh\_cfg\_t* \**config*)

Get mesh stack configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] `config`: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_set\_router** (**const** *mesh\_router\_t* \**router*)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `router`: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_get\_router** (*mesh\_router\_t* \**router*)

Get router configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] `router`: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_set\_id** (**const** *mesh\_addr\_t* \**id*)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

**Parameters**

- [in] `id`: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_get\_id** (*mesh\_addr\_t* \**id*)

Get mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] `id`: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_set\_type** (*mesh\_type\_t* *type*)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] type: device type

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int *max\_layer*)

Set network max layer value (max:25, default:25)

- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] max\_layer: max layer value

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

**Return** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \**pwd*, int *len*)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] pwd: pointer to the password
- [in] len: password length

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* *authmode*)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] authmode: authentication mode

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Return** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int *connections*)

Set mesh softAP max connection value.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `connections`: the number of max connections

int `esp_mesh_get_ap_connections` (void)

Get mesh softAP max connection configuration.

**Return** the number of max connections

int `esp_mesh_get_layer` (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event `MESH_EVENT_PARENT_CONNECTED`.

**Return** layer value

*esp\_err\_t* `esp_mesh_get_parent_bssid` (*mesh\_addr\_t* \**bssid*)

Get the parent BSSID.

**Attention** This API shall be called after having received the event `MESH_EVENT_PARENT_CONNECTED`.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] `bssid`: pointer to parent BSSID

bool `esp_mesh_is_root` (void)

Return whether the device is the root node of the network.

**Return** true/false

*esp\_err\_t* `esp_mesh_set_self_organized` (bool *enable*, bool *select\_parent*)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `enable`: enable or disable self-organized networking
- [in] `select_parent`: Only valid when self-organized networking is enabled.
  - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool `esp_mesh_get_self_organized` (void)

Return whether enable self-organized networking or not.

**Return** true/false

*esp\_err\_t* `esp_mesh_waive_root` (const *mesh\_vote\_t* \**vote*, int *reason*)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an `attempts` value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.

- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

**Parameters**

- [in] `vote`: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field `percentage` threshold is 0.9 by default.
  - Field `is_rc_specified` shall be false.
  - Field `attempts` shall be at least 15 times.
- [in] `reason`: only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float *percentage*)

Set vote percentage threshold for approval of being a root.

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `percentage`: vote percentage threshold

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

**Return** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int *seconds*)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `seconds`: the expired time

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Return** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Return** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Return** the number of devices over this device' s sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \**mac*, int *len*, int \**size*)

Get routing table of this device' s sub-network (including itself)

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] *mac*: pointer to routing table
- [in] *len*: routing table size(in bytes)
- [out] *size*: pointer to the number of devices in routing table (including itself)

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool *reachable*)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *reachable*: this state represents whether the root is able to access external IP network

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \**pending*)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] *pending*: pointer to the TX pending

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \**pending*)

Return the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] *pending*: pointer to the RX pending

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \**addr*, uint32\_t \**xseqno\_in*)

Return the number of packets could be accepted from the specified address.

**Return** the number of upQ for a certain address

**Parameters**

- [in] *addr*: self address or an associate children address
- [out] *xseqno\_in*: sequence number of the last received packet from the specified address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int *qsize*)

Set the number of queue.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *qsize*: default:32 (min:16)

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Return** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool *allowed*)

Set whether allow more than one root existing in one network.

**Return**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

**Parameters**

- [in] allowed: allow or not

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)  
Check whether allow more than one root to exist in one network.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)  
Set group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to new group ID addresses
- [in] num: the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)  
Delete group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to deleted group ID address
- [in] num: the number of group ID addresses

int **esp\_mesh\_get\_group\_num** (void)  
Get the number of group ID addresses.

**Return** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)  
Get group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] addr: pointer to group ID addresses
- [in] num: the number of group ID addresses

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \*addr)  
Check whether the specified group address is my group.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int num)  
Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] num: mesh network capacity

int **esp\_mesh\_get\_capacity\_num** (void)  
Get mesh network capacity.

**Return** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (**const** mesh\_crypto\_funcs\_t \**crypto\_funcs*)  
Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK

**Parameters**

- [in] *crypto\_funcs*: crypto functions for mesh IE
  - If *crypto\_funcs* is set to NULL, mesh IE is no longer encrypted.

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (**const** char \**key*, int *len*)  
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \**key*, int *len*)  
Get mesh IE crypto key.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int *delay\_ms*)  
Set delay time before starting root healing.

**Return**

- ESP\_OK

**Parameters**

- [in] *delay\_ms*: delay time in milliseconds

int **esp\_mesh\_get\_root\_healing\_delay** (void)  
Get delay time before network starts root healing.

**Return** delay time in milliseconds

*esp\_err\_t* **esp\_mesh\_fix\_root** (bool *enable*)  
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Return**

- ESP\_OK

**Parameters**

- [in] *enable*: enable or not

bool **esp\_mesh\_is\_root\_fixed** (void)  
Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_parent** (*const wifi\_config\_t \*parent*, *const mesh\_addr\_t \*parent\_mesh\_id*, *mesh\_type\_t my\_type*, *int my\_layer*)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

**Parameters**

- [in] *parent*: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] *parent\_mesh\_id*: parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- [in] *my\_type*: mesh type
  - If the parent set for the device is the same as the router in the network configuration, then *my\_type* shall set MESH\_ROOT and *my\_layer* shall set MESH\_ROOT\_LAYER.
- [in] *my\_layer*: mesh layer
  - *my\_layer* of the device may change after joining the network.
  - If *my\_type* is set MESH\_NODE, *my\_layer* shall be greater than MESH\_ROOT\_LAYER.
  - If *my\_type* is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_ie\_len** (*int \*len*)

Get mesh networking IE length of one AP.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] *len*: mesh networking IE length

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t \*ap\_record*, *void \*buffer*)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual\_networking” example.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] *ap\_record*: pointer to one AP record
- [out] *buffer*: pointer to the mesh networking IE of this AP

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (*void*)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (*const mesh\_addr\_t \*child\_mac*, *int \*nodes\_num*)

Get the number of nodes in the subnet of a specific child.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `child_mac`: an associated child address of this device
- [out] `nodes_num`: pointer to the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_get_subnet_nodes_list` (`const mesh_addr_t *child_mac`, `mesh_addr_t *nodes`, `int nodes_num`)

Get nodes in the subnet of a specific child.

**Return**

- `ESP_OK`
- `ESP_ERR_MESH_NOT_START`
- `ESP_ERR_MESH_ARGUMENT`

**Parameters**

- [in] `child_mac`: an associated child address of this device
- [out] `nodes`: pointer to nodes in the subnet of a specific child
- [in] `nodes_num`: the number of nodes in the subnet of a specific child

`esp_err_t esp_mesh_disconnect` (void)

Disconnect from current parent.

**Return**

- `ESP_OK`

`esp_err_t esp_mesh_connect` (void)

Connect to current parent.

**Return**

- `ESP_OK`

`esp_err_t esp_mesh_flush_scan_result` (void)

Flush scan result.

**Return**

- `ESP_OK`

`esp_err_t esp_mesh_switch_channel` (`const uint8_t *new_bssid`, `int csa_newchan`, `int csa_count`)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**

- `ESP_OK`

**Parameters**

- [in] `new_bssid`: the new router BSSID if the router changes
- [in] `csa_newchan`: the new channel number to which the whole network is moving
- [in] `csa_count`: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

`esp_err_t esp_mesh_get_router_bssid` (`uint8_t *router_bssid`)

Get the router BSSID.

**Return**

- `ESP_OK`
- `ESP_ERR_WIFI_NOT_INIT`
- `ESP_ERR_WIFI_ARG`

**Parameters**

- [out] `router_bssid`: pointer to the router BSSID

`int64_t esp_mesh_get_tsf_time` (void)

Get the TSF time.

**Return** the TSF time

## Unions

### **union mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

#### **Public Members**

*uint8\_t* **addr**[6]  
mac address

*mip\_t* **mip**  
mip address

### **union mesh\_event\_info\_t**

*#include <esp\_mesh.h>* Mesh event information.

#### **Public Members**

*mesh\_event\_channel\_switch\_t* **channel\_switch**  
channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**  
child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**  
child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**  
routing table change

*mesh\_event\_connected\_t* **connected**  
parent connected

*mesh\_event\_disconnected\_t* **disconnected**  
parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**  
no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**  
layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**  
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**  
vote started

*mesh\_event\_root\_address\_t* **root\_addr**  
root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**  
root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**  
other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**  
fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**  
scan done

*mesh\_event\_network\_state\_t* **network\_state**  
network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**  
network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**  
new router information

**union mesh\_rc\_config\_t**  
*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**  
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**  
a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

**struct mip\_t**  
IP address and port.

### Public Members

ip4\_addr\_t **ip4**  
IP address

uint16\_t **port**  
port

**struct mesh\_event\_channel\_switch\_t**  
Channel switch information.

### Public Members

uint8\_t **channel**  
new channel

**struct mesh\_event\_connected\_t**  
Parent connected information.

### Public Members

*wifi\_event\_sta\_connected\_t* **connected**  
parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint8\_t **self\_layer**  
layer

**struct mesh\_event\_no\_parent\_found\_t**  
No parent found information.

### Public Members

int **scan\_times**  
scan times being through

**struct mesh\_event\_layer\_change\_t**  
Layer change information.

**Public Members**

`uint8_t new_layer`  
new layer

**struct mesh\_event\_vote\_started\_t**  
vote started information

**Public Members**

int **reason**  
vote reason, vote could be initiated by children or by the root itself

int **attempts**  
max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**  
root address specified by users via API `esp_mesh_waive_root()`

**struct mesh\_event\_find\_network\_t**  
find a mesh network that this device can join

**Public Members**

`uint8_t channel`  
channel number of the new found network

`uint8_t router_bssid[6]`  
router BSSID

**struct mesh\_event\_root\_switch\_req\_t**  
Root switch request information.

**Public Members**

int **reason**  
root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**  
the address of root switch requester

**struct mesh\_event\_root\_conflict\_t**  
Other powerful root address.

**Public Members**

`int8_t rssi`  
rssi with router

`uint16_t capacity`  
the number of devices in current network

`uint8_t addr[6]`  
other powerful root address

**struct mesh\_event\_routing\_table\_change\_t**  
Routing table change.

**Public Members**

`uint16_t rt_size_new`  
the new value

`uint16_t rt_size_change`  
the changed value

**struct mesh\_event\_root\_fixed\_t**  
Root fixed.

**Public Members**

`bool is_fixed`  
status

**struct mesh\_event\_scan\_done\_t**  
Scan done event information.

**Public Members**

`uint8_t number`  
the number of APs scanned

**struct mesh\_event\_network\_state\_t**  
Network state information.

**Public Members**

`bool is_rootless`  
whether current mesh network has a root

**struct mesh\_opt\_t**  
Mesh option.

**Public Members**

`uint8_t type`  
option type

`uint16_t len`  
option length

`uint8_t *val`  
option value

**struct mesh\_data\_t**  
Mesh data for `esp_mesh_send()` and `esp_mesh_rcv()`

**Public Members**

`uint8_t *data`  
data

`uint16_t size`  
data size

`mesh_proto_t proto`  
data protocol

*mesh\_tos\_t* **tos**  
data type of service

**struct mesh\_router\_t**  
Router configuration.

### Public Members

uint8\_t **ssid**[32]  
SSID

uint8\_t **ssid\_len**  
length of SSID

uint8\_t **bssid**[6]  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

uint8\_t **password**[64]  
password

bool **allow\_router\_switch**  
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

### Public Members

uint8\_t **password**[64]  
mesh softAP password

uint8\_t **max\_connection**  
max number of stations allowed to connect in, max 10

**struct mesh\_cfg\_t**  
Mesh initialization configuration.

### Public Members

uint8\_t **channel**  
channel, the mesh network on

bool **allow\_channel\_switch**  
if this value is set, when “fail” (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**  
mesh network identification

*mesh\_router\_t* **router**  
router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**  
mesh softAP configuration

const mesh\_crypto\_funcs\_t \***crypto\_funcs**  
crypto functions

**struct mesh\_vote\_t**

Vote.

**Public Members**float **percentage**

vote percentage threshold for approval of being a root

bool **is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**

vote address configuration

**struct mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**int **to\_parent**

to parent queue

int **to\_parent\_p2p**

to parent (P2P) queue

int **to\_child**

to child queue

int **to\_child\_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

**struct mesh\_rx\_pending\_t**

The number of packets available in the queue waiting to be received by applications.

**Public Members**int **toDS**

to external DS

int **toSelf**

to self

**Macros****MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

<b>ESP_ERR_MESH_NOT_INIT</b>	mesh isn't initialized
<b>ESP_ERR_MESH_NOT_CONFIG</b>	mesh isn't configured
<b>ESP_ERR_MESH_NOT_START</b>	mesh isn't started
<b>ESP_ERR_MESH_NOT_SUPPORT</b>	not supported yet
<b>ESP_ERR_MESH_NOT_ALLOWED</b>	operation is not allowed
<b>ESP_ERR_MESH_NO_MEMORY</b>	out of memory
<b>ESP_ERR_MESH_ARGUMENT</b>	illegal argument
<b>ESP_ERR_MESH_EXCEED_MTU</b>	packet size exceeds MTU
<b>ESP_ERR_MESH_TIMEOUT</b>	timeout
<b>ESP_ERR_MESH_DISCONNECTED</b>	disconnected with parent on station interface
<b>ESP_ERR_MESH_QUEUE_FAIL</b>	queue fail
<b>ESP_ERR_MESH_QUEUE_FULL</b>	queue full
<b>ESP_ERR_MESH_NO_PARENT_FOUND</b>	no parent found to join the mesh network
<b>ESP_ERR_MESH_NO_ROUTE_FOUND</b>	no route found to forward the packet
<b>ESP_ERR_MESH_OPTION_NULL</b>	no option found
<b>ESP_ERR_MESH_OPTION_UNKNOWN</b>	unknown option
<b>ESP_ERR_MESH_XON_NO_WINDOW</b>	no window for software flow control on upstream
<b>ESP_ERR_MESH_INTERFACE</b>	low-level Wi-Fi interface error
<b>ESP_ERR_MESH_DISCARD_DUPLICATE</b>	discard the packet due to the duplicate sequence number
<b>ESP_ERR_MESH_DISCARD</b>	discard the packet
<b>ESP_ERR_MESH_VOTING</b>	vote in progress
<b>ESP_ERR_MESH_XMIT</b>	XMIT
<b>ESP_ERR_MESH_QUEUE_READ</b>	error in reading queue

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_recv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_recv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_recv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_recv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_INIT\_CONFIG\_DEFAULT ( )****Type Definitions****typedef** *mesh\_addr\_t* mesh\_event\_root\_address\_t

Root address.

**typedef** *wifi\_event\_sta\_disconnected\_t* mesh\_event\_disconnected\_t

Parent disconnected information.

**typedef** *wifi\_event\_ap\_staconnected\_t* mesh\_event\_child\_connected\_t

Child connected information.

**typedef** *wifi\_event\_ap\_stadisconnected\_t* mesh\_event\_child\_disconnected\_t

Child disconnected information.

**typedef** *wifi\_event\_sta\_connected\_t* mesh\_event\_router\_switch\_t

New router information.

**Enumerations****enum mesh\_event\_id\_t**

Enumerated list of mesh event id.

*Values:*

**MESH\_EVENT\_STARTED**

mesh is started

**MESH\_EVENT\_STOPPED**

mesh is stopped

**MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

**MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

**MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

**MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

**MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

**MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

**MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

**MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

**MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

**MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network

**MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

**MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

**MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

**MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

**MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

**MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

**MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

**MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH\_EVENT\_MAX****enum mesh\_type\_t**

Device type.

*Values:*

**MESH\_IDLE**

hasn't joined the mesh network yet

**MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**MESH\_LEAF**

has no forwarding ability

**MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

**enum mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

**MESH\_PROTO\_BIN**

binary

**MESH\_PROTO\_HTTP**

HTTP protocol

**MESH\_PROTO\_JSON**

JSON format

**MESH\_PROTO\_MQTT**

MQTT protocol

**enum mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

**MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

**MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

**MESH\_TOS\_DEF**

no retransmission on mesh stack

**enum mesh\_vote\_reason\_t**

Vote reason.

*Values:***MESH\_VOTE\_REASON\_ROOT\_INITIATED = 1**

vote is initiated by the root

**MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

**enum mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:***MESH\_REASON\_CYCLIC = 100**

cyclic is detected

**MESH\_REASON\_PARENT\_IDLE**

parent is idle

**MESH\_REASON\_LEAF**

the connected device is changed to a leaf

**MESH\_REASON\_DIFF\_ID**

in different mesh ID

**MESH\_REASON\_ROOTS**

root conflict is detected

**MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

**MESH\_REASON\_SCAN\_FAIL**

scan fail

**MESH\_REASON\_IE\_UNKNOWN**

unknown IE

**MESH\_REASON\_WAIVE\_ROOT**

waive root

**MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

**MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

**MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

**enum mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:***MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

**MESH\_TODS\_REACHABLE**

the root is able to access external IP network

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.Code examples for ESP-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

## 2.2.2 Ethernet

### Ethernet

#### Application Example

- Ethernet basic example: [ethernet/ethernet](#).
- Ethernet iperf example: [ethernet/iperf](#).

#### Ethernet Driver Model

- [esp\\_eth/include/esp\\_eth.h](#)

#### Ethernet Common Interface

- [esp\\_eth/include/esp\\_eth\\_com.h](#)

#### Ethernet MAC Interface

- [esp\\_eth/include/esp\\_eth\\_mac.h](#)

#### Ethernet PHY Interface

- [esp\\_eth/include/esp\\_eth\\_phy.h](#)

#### Ethernet PHY Common Registers

- [esp\\_eth/include/eth\\_phy\\_regs\\_struct.h](#)

### API Reference - Driver Model

#### Header File

- [esp\\_eth/include/esp\\_eth.h](#)

#### Functions

*esp\_err\_t* **esp\_eth\_driver\_install** (**const** *esp\_eth\_config\_t* \**config*, *esp\_eth\_handle\_t* \**out\_hdl*)

Install Ethernet driver.

#### Return

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

#### Parameters

- [in] *config*: configuration of the Ethernet driver
- [out] *out\_hdl*: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* *hdl*)

Uninstall Ethernet driver.

**Note** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

#### Return

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument

- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- ESP\_OK: start esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: start esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: start esp\_eth driver failed because driver has started already
- ESP\_FAIL: start esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

**Note** This function does the opposite operation of esp\_eth\_start.

**Return**

- ESP\_OK: stop esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: stop esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: stop esp\_eth driver failed because driver has not started yet
- ESP\_FAIL: stop esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input) *esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv

, void \*priv) Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**

- ESP\_OK: update input path successfully
- ESP\_ERR\_INVALID\_ARG: update input path failed because of some invalid argument
- ESP\_FAIL: update input path failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] stack\_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack\_input callback without any modification

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, uint32\_t length)

General Transmit.

**Return**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

*esp\_err\_t* **esp\_eth\_receive** (*esp\_eth\_handle\_t* hdl, uint8\_t \*buf, uint32\_t \*length)

General Receive.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Return**

- ESP\_OK: receive frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: receive frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive frame buffer failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Ethernet driver.

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
- [in] data: specified data for command

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

**Structures**

**struct esp\_eth\_config\_t**

Configuration of Ethernet driver.

**Public Members**

*esp\_eth\_mac\_t* \*mac

Ethernet MAC object.

*esp\_eth\_phy\_t* \*phy

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (\***stack\_input**) (*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

**Parameters**

- [in] eth\_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

*esp\_err\_t* (\***on\_lowlevel\_init\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

**Macros**

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

**Type Definitions**

**typedef** void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

**API Reference - Common Interface****Header File**

- [esp\\_eth/include/esp\\_eth\\_com.h](#)

**Functions**

*esp\_err\_t* **esp\_eth\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, uint32\_t \*detected\_addr)

Detect PHY address.

**Return**

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [out] detected\_addr: a valid address after detection

## Structures

**struct esp\_eth\_mediator\_s**

Ethernet mediator.

## Public Members

*esp\_err\_t* (**\*phy\_reg\_read**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

### Return

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (**\*phy\_reg\_write**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

### Return

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [in] reg\_value: PHY register value

*esp\_err\_t* (**\*stack\_input**) (*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

### Return

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

*esp\_err\_t* (**\*on\_state\_changed**) (*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

### Return

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

## Macros

**ETH\_MAX\_PAYLOAD\_LEN**

Maximum Ethernet payload size.

**ETH\_MIN\_PAYLOAD\_LEN**

Minimum Ethernet payload size.

**ETH\_HEADER\_LEN**

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

**ETH\_CRC\_LEN**

Ethernet frame CRC length.

**ETH\_VLAN\_TAG\_LEN**

Optional 802.1q VLAN Tag length.

**ETH\_JUMBO\_FRAME\_PAYLOAD\_LEN**

Jumbo frame payload size.

**ETH\_MAX\_PACKET\_SIZE**

Maximum frame size (1522 Bytes)

**ETH\_MIN\_PACKET\_SIZE**

Minimum frame size (64 Bytes)

**Type Definitions****typedef struct *esp\_eth\_mediator\_s* esp\_eth\_mediator\_t**

Ethernet mediator.

**Enumerations****enum esp\_eth\_state\_t**

Ethernet driver state.

*Values:***ETH\_STATE\_LLINIT**

Lowlevel init done

**ETH\_STATE\_DEINIT**

Deinit done

**ETH\_STATE\_LINK**

Link status changed

**ETH\_STATE\_SPEED**

Speed updated

**ETH\_STATE\_DUPLEX**

Duplex updated

**enum esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:***ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

**ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

**ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

**ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

**ETH\_CMD\_G\_SPEED**

Get Speed

**ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

**enum eth\_link\_t**

Ethernet link status.

*Values:***ETH\_LINK\_UP**

Ethernet link is up

**ETH\_LINK\_DOWN**

Ethernet link is down

**enum eth\_speed\_t**

Ethernet speed.

*Values:***ETH\_SPEED\_10M**

Ethernet speed is 10Mbps

**ETH\_SPEED\_100M**

Ethernet speed is 100Mbps

**enum eth\_duplex\_t**

Ethernet duplex mode.

*Values:***ETH\_DUPLEX\_HALF**

Ethernet is in half duplex

**ETH\_DUPLEX\_FULL**

Ethernet is in full duplex

**enum eth\_event\_t**

Ethernet event declarations.

*Values:***ETHERNET\_EVENT\_START**

Ethernet driver start

**ETHERNET\_EVENT\_STOP**

Ethernet driver stop

**ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

**ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

**API Reference - MAC Interface****Header File**

- [esp\\_eth/include/esp\\_eth\\_mac.h](#)

**Structures****struct esp\_eth\_mac\_s**

Ethernet MAC.

**Public Members***esp\_err\_t* (\***set\_mediator**) (*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

*esp\_err\_t* (\***init**) (*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***deinit**) (*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***start**) (*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***stop**) (*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***transmit**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_ARG: transmit packet failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: transmit packet failed because of wrong state of MAC
- ESP\_FAIL: transmit packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] buf: packet buffer to transmit
- [in] length: length of packet

*esp\_err\_t* (\***receive**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

**Note** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

*esp\_err\_t* (**\*read\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] phy\_addr: PHY chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (**\*write\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] phy\_addr: PHY chip address (0~31)
- [in] phy\_reg: PHY register index code
- [in] reg\_value: PHY register value

*esp\_err\_t* (**\*set\_addr**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

*esp\_err\_t* (**\*get\_addr**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

- [out] addr: MAC address

*esp\_err\_t* (\***set\_speed**) (*esp\_eth\_mac\_t* \*mac, *eth\_speed\_t* speed)  
Set speed of MAC.

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

*esp\_err\_t* (\***set\_duplex**) (*esp\_eth\_mac\_t* \*mac, *eth\_duplex\_t* duplex)  
Set duplex mode of MAC.

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

*esp\_err\_t* (\***set\_link**) (*esp\_eth\_mac\_t* \*mac, *eth\_link\_t* link)  
Set link status of MAC.

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] link: Link status

*esp\_err\_t* (\***set\_promiscuous**) (*esp\_eth\_mac\_t* \*mac, bool enable)  
Set promiscuous of MAC.

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

*esp\_err\_t* (\***del**) (*esp\_eth\_mac\_t* \*mac)  
Free memory of Ethernet MAC.

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

**struct eth\_mac\_config\_t**  
Configuration of Ethernet MAC object.

**Public Members**

uint32\_t **sw\_reset\_timeout\_ms**  
Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**  
Stack size of the receive task

`uint32_t rx_task_prio`  
Priority of the receive task

`int smi_mdc_gpio_num`  
SMI MDC GPIO number

`int smi_mdio_gpio_num`  
SMI MDIO GPIO number

`uint32_t flags`  
Flags that specify extra capability for mac driver

### Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**  
MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**  
Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG()**  
Default configuration for Ethernet MAC object.

### Type Definitions

**typedef struct esp\_eth\_mac\_s esp\_eth\_mac\_t**  
Ethernet MAC.

### API Reference - PHY Interface

#### Header File

- [esp\\_eth/include/esp\\_eth\\_phy.h](#)

#### Functions

`esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)`  
Create a PHY instance of IP101.

##### Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

##### Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t *esp_eth_phy_new_rt18201(const eth_phy_config_t *config)`  
Create a PHY instance of RTL8201.

##### Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

##### Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t *esp_eth_phy_new_lan8720(const eth_phy_config_t *config)`  
Create a PHY instance of LAN8720.

##### Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

##### Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)`  
Create a PHY instance of DP83848.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

**Structures****struct esp\_eth\_phy\_s**

Ethernet PHY.

**Public Members***esp\_err\_t* (**\*set\_mediator**) (*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

*esp\_err\_t* (**\*reset**) (*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (**\*reset\_hw**) (*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

**Note** Hardware reset is mostly done by pull down and up PHY's nRST pin**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (**\*init**) (*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (**\*deinit**) (*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

**Parameters**

- [in] phyL: Ethernet PHY instance

*esp\_err\_t* (**\*negotiate**) (*esp\_eth\_phy\_t* \*phy)

Start auto negotiation.

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***pwrcctl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

**Parameters**

- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

*esp\_err\_t* (\***del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

**struct eth\_phy\_config\_t**

Ethernet PHY configuration.

**Public Members**

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

`uint32_t autonego_timeout_ms`  
Auto-negotiation timeout value (Unit: ms)

`int reset_gpio_num`  
Reset GPIO number, -1 means no hardware reset

### Macros

`ESP_ETH_PHY_ADDR_AUTO`  
`ETH_PHY_DEFAULT_CONFIG()`  
Default configuration for Ethernet PHY object.

### Type Definitions

`typedef struct esp_eth_phy_s esp_eth_phy_t`  
Ethernet PHY.

### API Reference - Glue for esp\_netif

#### Header File

- [esp\\_eth/include/esp\\_eth\\_netif\\_glue.h](#)

#### Functions

`void *esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)`  
Create a netif glue for Ethernet driver.

**Note** netif glue is used to attach io driver to TCP/IP netif

**Return** glue object, which inherits esp\_netif\_driver\_base\_t

#### Parameters

- eth\_hdl: Ethernet driver handle

`esp_err_t esp_eth_del_netif_glue(void *glue)`  
Delete netif glue of Ethernet driver.

**Return** -ESP\_OK: delete netif glue successfully

#### Parameters

- glue: netif glue

`esp_err_t esp_eth_set_default_handlers(void *esp_netif)`  
Register default IP layer handlers for Ethernet.

**Note** : Ethernet handle might not yet properly initialized when setting up these default handlers

#### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp\_netif is NULL)
- ESP\_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp\_event handler

#### Parameters

- [in] esp\_netif: esp network interface handle created for Ethernet driver

`esp_err_t esp_eth_clear_default_handlers(void *esp_netif)`  
Unregister default IP layer handlers for Ethernet.

#### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp\_netif is NULL)
- ESP\_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp\_event handler

#### Parameters

- [in] esp\_netif: esp network interface handle created for Ethernet driver

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

### 2.2.3 IP Network Layer

#### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

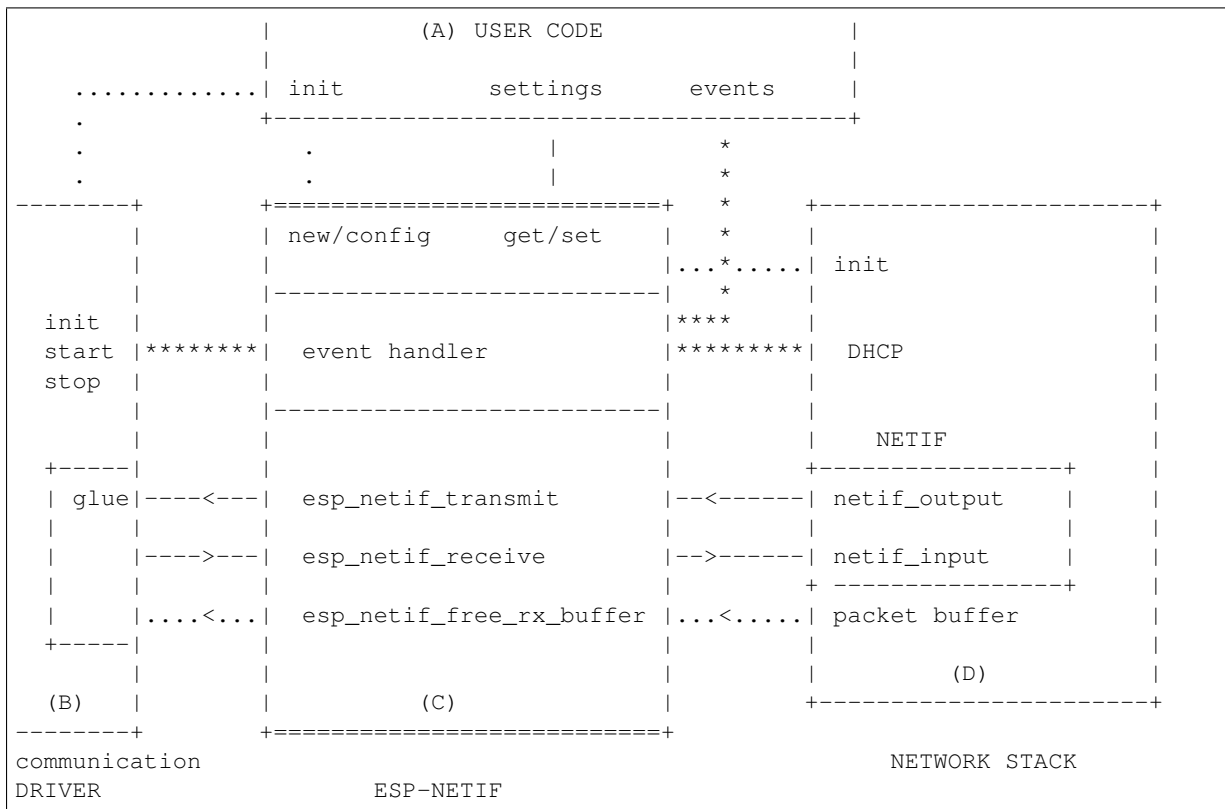

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the `tcpip_adapter`, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP Adapter Migration Guide](#) section in case existing applications to be ported to use the `esp-netif` API instead.

#### ESP-NETIF architecture

#### Data and event flow in the diagram

- ..... Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

#### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF, former tcpip\_adapter** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**ESP-NETIF programmer' s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- [esp\\_netif\\_create\\_default\\_wifi\\_ap\(\)](#)
- [esp\\_netif\\_create\\_default\\_wifi\\_sta\(\)](#)

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using [esp\\_netif\\_destroy\(\)](#).
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- [esp\\_netif/include/esp\\_netif.h](#)

### Functions

*esp\_err\_t* **esp\_netif\_init** (void)

Initialize the underlying TCP/IP stack.

#### Return

- ESP\_OK on success
- ESP\_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

*esp\_err\_t* **esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

#### Return

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

`esp_netif_t` \***esp\_netif\_new** (const `esp_netif_config_t` \**esp\_netif\_config*)

Creates an instance of new esp-netif object based on provided config.

#### Return

- pointer to esp-netif object on success
- NULL otherwise

#### Parameters

- [in] `esp_netif_config`: pointer esp-netif configuration

void **esp\_netif\_destroy** (`esp_netif_t` \**esp\_netif*)

Destroys the esp\_netif object.

#### Parameters

- [in] `esp_netif`: pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \**esp\_netif*, **const** *esp\_netif\_driver\_ifconfig\_t* \**driver\_config*)

Configures driver related options of *esp\_netif* object.

#### Return

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

#### Parameters

- [inout] *esp\_netif*: pointer to the object to be configured
- [in] *driver\_config*: pointer esp-netif io driver related configuration

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_io\_driver\_handle\_t* *driver\_handle*)

Attaches *esp\_netif* instance to the io driver handle.

Calling this function enables connecting specific *esp\_netif* object with already initialized io driver to update *esp\_netif* object with driver specific configuration (i.e. calls *post\_attach* callback, which typically sets io driver callbacks to *esp\_netif* instance and starts the driver)

#### Return

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's *post\_attach* callback failed

#### Parameters

- [inout] *esp\_netif*: pointer to *esp\_netif* object to be attached
- [in] *driver\_handle*: pointer to the driver handle

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \**esp\_netif*, *void* \**buffer*, *size\_t* *len*, *void* \**eb*)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

#### Return

- ESP\_OK

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance
- [in] *buffer*: Received data
- [in] *len*: Length of the data frame
- [in] *eb*: Pointer to internal buffer (used in Wi-Fi driver)

*void* **esp\_netif\_action\_start** (*void* \**esp\_netif*, *esp\_event\_base\_t* *base*, *int32\_t* *event\_id*, *void* \**data*)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

**Note** This API can be directly used as event handler

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance
- *base*:
- *event\_id*:
- *data*:

*void* **esp\_netif\_action\_stop** (*void* \**esp\_netif*, *esp\_event\_base\_t* *base*, *int32\_t* *event\_id*, *void* \**data*)

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance
- *base*:
- *event\_id*:
- *data*:

*void* **esp\_netif\_action\_connected** (*void* \**esp\_netif*, *esp\_event\_base\_t* *base*, *int32\_t* *event\_id*, *void* \**data*)

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_disconnected**(void \**esp\_netif*, *esp\_event\_base\_t* *base*, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_got\_ip**(void \**esp\_netif*, *esp\_event\_base\_t* *base*, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

*esp\_err\_t* **esp\_netif\_set\_mac**(*esp\_netif\_t* \**esp\_netif*, uint8\_t *mac*[])

Set the mac address for the interface instance.

**Return** ESP\_OK

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `mac`: Desired mac address for the related network interface

*esp\_err\_t* **esp\_netif\_set\_hostname**(*esp\_netif\_t* \**esp\_netif*, const char \**hostname*)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG\_LWIP\_LOCAL\_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `hostname`: New hostname for the interface. Maximum length 32 bytes.

*esp\_err\_t* **esp\_netif\_get\_hostname**(*esp\_netif\_t* \**esp\_netif*, const char \*\**hostname*)

Get interface hostname.

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `hostname`: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool **esp\_netif\_is\_netif\_up**(*esp\_netif\_t* \**esp\_netif*)

Test if supplied interface is up or down.

**Return**

- true - Interface is up
- false - Interface is down

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (`esp_netif_t *esp_netif`, `esp_netif_ip_info_t *ip_info`)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (`esp_netif_t *esp_netif`, `esp_netif_ip_info_t *ip_info`)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (`esp_netif_t *esp_netif`, **const** `esp_netif_ip_info_t *ip_info`)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: IP information to set on the specified interface

*esp\_err\_t* **esp\_netif\_set\_old\_ip\_info** (`esp_netif_t *esp_netif`, **const** `esp_netif_ip_info_t *ip_info`)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: Store the old IP information for the specified interface

int **esp\_netif\_get\_netif\_impl\_index** (esp\_netif\_t \*esp\_netif)

Get net interface index from network stack implementation.

**Note** This index could be used in `setsockopt()` to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied `esp_netif`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcps\_option** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_option\_mode\_t opt\_op, esp\_netif\_dhcp\_option\_id\_t opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP server option.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_option\_mode\_t opt\_op, esp\_netif\_dhcp\_option\_id\_t opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (esp\_netif\_t \*esp\_netif)

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events call this function.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (`esp_netif_t *esp_netif`)

Stop DHCP client (only if enabled in interface object)

**Note** Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_IF_NOT_READY`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_status_t *status`)

Get DHCP client status.

**Return**

- `ESP_OK`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `status`: If successful, the status of DHCP client will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_status_t *status`)

Get DHCP Server status.

**Return**

- `ESP_OK`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `status`: If successful, the status of the DHCP server will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_start** (`esp_netif_t *esp_netif`)

Start DHCP server (only if enabled in interface object)

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (`esp_netif_t *esp_netif`)

Stop DHCP server (only if enabled in interface object)

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_IF_NOT_READY`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (`esp_netif_t *esp_netif`, `esp_netif_dns_type_t type`, `esp_netif_dns_info_t *dns`)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
- This function can override it by setting server type `ESP_NETIF_DNS_MAIN`.
- Other DNS Server types are not supported for the Wi-Fi AP interface.

**Return**

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `type`: Type of DNS Server to set: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- [in] `dns`: DNS Server address to set

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (`esp_netif_t *esp_netif`, `esp_netif_dns_type_t type`, `esp_netif_dns_info_t *dns`)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `type`: Type of DNS Server to get: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- [out] `dns`: DNS Server result is written here on success

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (`esp_netif_t *esp_netif`)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a `SYSTEM_EVENT_GOT_IP6` event will be sent.

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (`esp_netif_t *esp_netif`, `esp_ip6_addr_t *if_ip6`)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**

- `ESP_OK`
- `ESP_FAIL` If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `if_ip6`: IPv6 information will be returned in this argument if successful.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (`esp_netif_t *esp_netif`, `esp_ip6_addr_t *if_ip6`)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `if_ip6`: IPv6 information will be returned in this argument if successful.

void **esp\_netif\_set\_ip4\_addr** (`esp_ip4_addr_t *addr`, `uint8_t a`, `uint8_t b`, `uint8_t c`, `uint8_t d`)  
Sets IPv4 address to the specified octets.

**Parameters**

- [out] `addr`: IP address to be set
- `a`: the first octet (127 for IP 127.0.0.1)
- `b`:
- `c`:
- `d`:

char \***esp\_ip4addr\_ntoa** (`const esp_ip4_addr_t *addr`, `char *buf`, `int buflen`)  
Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to `buf` which now holds the ASCII representation of `addr` or NULL if `buf` was too small

**Parameters**

- `addr`: ip address in network order to convert
- `buf`: target buffer where the string is stored
- `buflen`: length of `buf`

uint32\_t **esp\_ip4addr\_aton** (`const char *addr`)  
Ascii internet address interpretation routine The value returned is in network order.

**Return** ip address in network order

**Parameters**

- `addr`: IP address in ascii representation (e.g. "127.0.0.1" )

esp\_netif\_io\_driver\_handle **esp\_netif\_get\_io\_driver** (`esp_netif_t *esp_netif`)  
Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

esp\_netif\_t \***esp\_netif\_get\_handle\_from\_ifkey** (`const char *if_key`)  
Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- `if_key`: Textual description of network interface

esp\_netif\_flags\_t **esp\_netif\_get\_flags** (`esp_netif_t *esp_netif`)  
Returns configured flags for this interface.

**Return** Configuration flags

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

const char \***esp\_netif\_get\_ifkey** (`esp_netif_t *esp_netif`)  
Returns configured interface key for this esp-netif instance.

**Return** Textual description of related interface

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

const char \***esp\_netif\_get\_desc** (`esp_netif_t *esp_netif`)  
Returns configured interface type for this esp-netif instance.

**Return** Enumerated type of this interface, such as station, AP, ethernet

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)`

Returns configured event for this esp-netif instance and supplied event type.

**Return** specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event\_type is not known

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `event_type`: (either get or lost IP)

`esp_netif_t *esp_netif_next(esp_netif_t *esp_netif)`

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Return** First netif from the list if supplied parameter is NULL, next one otherwise

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`size_t esp_netif_get_nr_of_ifs(void)`

Returns number of registered esp\_netif objects.

**Return** Number of esp\_netifs

## WiFi default API reference

### Header File

- [esp\\_wifi/include/esp\\_wifi\\_default.h](#)

### Functions

`esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)`

Attaches wifi station interface to supplied netif.

**Return**

- `ESP_OK` on success
- `ESP_FAIL` if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi station to

`esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)`

Attaches wifi soft AP interface to supplied netif.

**Return**

- `ESP_OK` on success
- `ESP_FAIL` if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi AP to

`esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`

Sets default wifi event handlers for STA interface.

**Return**

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

`esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`

Sets default wifi event handlers for STA interface.

**Return**

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

`esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void *esp_netif)`

Clears default wifi event handlers for supplied network interface.

**Return**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

**Parameters**

- esp\_netif: instance of corresponding if object

esp\_netif\_t \***esp\_netif\_create\_default\_wifi\_ap**(void)

Creates default WIFI AP. In case of any init error this API aborts.

**Return** pointer to esp-netif instance

esp\_netif\_t \***esp\_netif\_create\_default\_wifi\_sta**(void)

Creates default WIFI STA. In case of any init error this API aborts.

**Return** pointer to esp-netif instance

esp\_err\_t **esp\_netif\_create\_default\_wifi\_mesh\_netifs**(esp\_netif\_t \*\*p\_netif\_sta,  
esp\_netif\_t \*\*p\_netif\_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** ESP\_OK on success

**Parameters**

- [out] p\_netif\_sta: pointer where the resultant STA interface is saved (if non NULL)
- [out] p\_netif\_ap: pointer where the resultant AP interface is saved (if non NULL)

## TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip\_adapter API to its successor [ESP-NETIF](#).

### Updating network connection code

**Network stack initialization** Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the [ESP-NETIF](#) initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

**Network interface creation** TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the [ESP-NETIF](#) to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta()`; or `esp_netif_create_default_wifi_ap()`; after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)

**Replacing other tcpip\_adapter API** All the tcpip\_adapter functions have their esp-netif counter-part. Please refer to the esp\_netif.h grouped into these sections:

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

**Default event handlers** Event handlers are moved from tcpip\_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

Instead of

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since ip4addr\_ntoa() is a LwIP API, the esp-netif provides esp\_ip4addr\_ntoa() as a replacement, but the above method is generally preferred.

**IP addresses** It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. \* [esp-netif IP address definitions](#)

**Next steps** Additional step in porting an application to fully benefit from the *ESP-NETIF* is to disable the tcpip\_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip\_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- [esp\\_netif\\_transmit\(\)](#)
- [esp\\_netif\\_free\\_rx\\_buffer\(\)](#)
- [esp\\_netif\\_receive\(\)](#)

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls [esp\\_netif\\_receive\(\)](#) on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t  
↳ driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↳esp-netif driver */
    driver_impl          *h;               /*!< handle of driver_
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

### Header File

- `esp_netif/include/esp_netif_net_stack.h`

## Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)`

Returns esp-netif handle.

**Return** handle to related esp-netif instance

### Parameters

- [in] dev: opaque ptr to network interface of specific TCP/IP stack

`void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Return** handle to related network stack netif handle

### Parameters

- [in] esp\_netif: Handle to esp-netif instance

`esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Return** ESP\_OK on success, an error passed from the I/O driver otherwise

### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

`void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)`

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [in] buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the [TCP/IP Adapter Migration Guide](#) to update existing IDF applications.

## 2.2.4 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.3 Peripherals API

### 2.3.1 Analog to Digital Converter

#### Overview

The ESP32 integrates two 12-bit SAR ([Successive Approximation Register](#)) ADCs supporting a total of 18 measurement channels (analog enabled pins).

The ADC driver API supports ADC1 (8 channels, attached to GPIOs 32 - 39), and ADC2 (10 channels, attached to GPIOs 0, 2, 4, 12 - 15 and 25 - 27). However, the usage of ADC2 has some restrictions for the application:

1. ADC2 is used by the Wi-Fi driver. Therefore the application can only use ADC2 when the Wi-Fi driver has not started.

2. Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:

- *ESP32 DevKitC*: GPIO 0 cannot be used due to external auto program circuits.
- *ESP-WROVER-KIT*: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

### Configuration and Reading ADC

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

---

**Note:** Since the ADC2 is shared with the WIFI module, which has higher priority, reading operation of `adc2_get_raw()` will fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

---

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from *ULP*. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc2_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section *Minimizing Noise*.

### Application Examples

Reading voltage on ADC1 channel 0 (GPIO 36):

```
#include <driver/adc.h>

...

adc1_config_width(ADC_WIDTH_BIT_12);
adc1_config_channel_atten(ADC1_CHANNEL_0, ADC_ATTEN_DB_0);
int val = adc1_get_raw(ADC1_CHANNEL_0);
```

The input voltage in above example is from 0 to 1.1V (0 dB attenuation). The input range can be extended by setting higher attenuation, see `adc_atten_t`. An example using the ADC driver including calibration (discussed below) is available in esp-idf: [peripherals/adc](#)

Reading voltage on ADC2 channel 7 (GPIO 27):

```
#include <driver/adc.h>

...

int read_raw;
adc2_config_channel_atten( ADC2_CHANNEL_7, ADC_ATTEN_0db );
```

(continues on next page)

(continued from previous page)

```

esp_err_t r = adc2_get_raw( ADC2_CHANNEL_7, ADC_WIDTH_12Bit, &read_raw);
if ( r == ESP_OK ) {
    printf("%d\n", read_raw );
} else if ( r == ESP_ERR_TIMEOUT ) {
    printf("ADC2 used by Wi-Fi.\n");
}

```

The reading may fail due to collision with Wi-Fi, should check it. An example using the ADC2 driver to read the output of DAC is available in esp-idf: [peripherals/adc2](#)

Reading the internal hall effect sensor:

```

#include <driver/adc.h>
...

adc1_config_width(ADC_WIDTH_BIT_12);
int val = hall_sensor_read();

```

The value read in both these examples is 12 bits wide (range 0-4095).

### Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

Fig. 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

## ADC Calibration

The `esp_adc_cal/include/esp_adc_cal.h` API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages ( $V_{ref}$ ) between chips. Per design the ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

Fig. 5: Graph illustrating effect of differing reference voltages on the ADC voltage curve.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of  $y = \text{coeff\_a} * x + \text{coeff\_b}$  and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values** Calibration values are used to generate characteristic curves that account for the unique ADC reference voltage of a particular ESP32. There are currently three sources of calibration values. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs' readings at 150mV and 850mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, **Default Vref** will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running [espefuse.py](https://github.com/espressif/esptool) tool with `adc_info` parameter

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Fig. 6: ESP32 Chip Surface Marking

Replace `/dev/ttyUSB0` with ESP32 board's port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093mV) will be reported as follows:

```
ADC VRef calibration: 1093mV
```

In another example below the **eFuse Vref** is not programmed:

```
ADC VRef calibration: None (1100mV nominal)
```

For a chip with two point calibration the message will look similar to:

```
ADC VRef calibration: 1149mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading  (150mV): 306
  ADC1 High reading (850mV): 3153
  ADC2 Low reading  (150mV): 389
  ADC2 High reading (850mV): 3206
```

**Application Example** For a full example see esp-idf: [peripherals/adc](#)

Characterizing an ADC at a particular attenuation:

```
#include "driver/adc.h"
#include "esp_adc_cal.h"

...

//Characterize ADC at particular atten
esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_
↪characteristics_t));
esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_
↪BIT_12, DEFAULT_VREF, adc_chars);
//Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
```

(continues on next page)

(continued from previous page)

```
} else {
    printf("Default");
}
```

Reading an ADC then converting the reading to a voltage:

```
#include "driver/adc.h"
#include "esp_adc_cal.h"

...
uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for **Default Vref**):

```
#include "driver/adc.h"

...

esp_err_t status = adc2_vref_to_gpio(GPIO_NUM_25);
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}
```

## GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0 (36);
2. `ADC1_GPIO32_CHANNEL` is the ADC1 channel number of GPIO 32 (ADC1 channel 4).

## API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

### ADC driver

#### Header File

- [driver/include/driver/adc.h](#)

#### Functions

`esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)`

Get the GPIO number of a specific ADC1 channel.

##### Return

- `ESP_OK` if success
- `ESP_ERR_INVALID_ARG` if channel not valid

##### Parameters

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

*esp\_err\_t* **adc1\_config\_width** (*adc\_bits\_width\_t* width\_bit)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- width\_bit: Bit capture width for ADC1

*esp\_err\_t* **adc\_set\_data\_width** (*adc\_unit\_t* adc\_unit, *adc\_bits\_width\_t* width\_bit)

Configure ADC capture width.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- adc\_unit: ADC unit index
- width\_bit: Bit capture width for ADC unit.

*esp\_err\_t* **adc1\_config\_channel\_atten** (*adc1\_channel\_t* channel, *adc\_atten\_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. `adc1_get_raw()` can then be called for any configured channel.

When VDD\_A is 3.3 V:

- 0 dB attenuation (ADC\_ATTEN\_DB\_0) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC\_ATTEN\_DB\_2\_5) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC\_ATTEN\_DB\_6) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC\_ATTEN\_DB\_11) gives full-scale voltage 3.9 V (see note below)

Due to ADC characteristics, most accurate results are obtained within the following approximate voltage ranges:

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC1 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD\_A, not the full scale voltage.

- 0 dB attenuation (ADC\_ATTEN\_DB\_0) between 100 and 950 mV
- 2.5 dB attenuation (ADC\_ATTEN\_DB\_2\_5) between 100 and 1250 mV
- 6 dB attenuation (ADC\_ATTEN\_DB\_6) between 150 to 1750 mV
- 11 dB attenuation (ADC\_ATTEN\_DB\_11) between 150 to 2450 mV

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- channel: ADC1 channel to configure
- atten: Attenuation level

int **adc1\_get\_raw** (*adc1\_channel\_t* channel)

Take an ADC1 reading from a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for

any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**

- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**

- `channel`: ADC1 channel to read

void **adc\_power\_on** (void)  
Enable ADC power.

void **adc\_power\_off** (void)  
Power off SAR ADC.

void **adc\_power\_acquire** (void)  
Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void **adc\_power\_release** (void)  
Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

*esp\_err\_t* **adc\_gpio\_init** (*adc\_unit\_t* `adc_unit`, *adc\_channel\_t* `channel`)  
Initialize ADC pad.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `adc_unit`: ADC unit index
- `channel`: ADC channel index

*esp\_err\_t* **adc\_set\_data\_inv** (*adc\_unit\_t* `adc_unit`, bool `inv_en`)  
Set ADC data invert.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `adc_unit`: ADC unit index
- `inv_en`: whether enable data invert

*esp\_err\_t* **adc\_set\_clk\_div** (uint8\_t `clk_div`)  
Set ADC source clock.

**Return**

- ESP\_OK success

**Parameters**

- `clk_div`: ADC clock divider, ADC clock is divided from APB clock

*esp\_err\_t* **adc\_set\_i2s\_data\_source** (*adc\_i2s\_source\_t* `src`)  
Set I2S data source.

**Return**

- ESP\_OK success

**Parameters**

- `src`: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

*esp\_err\_t* **adc\_i2s\_mode\_init** (*adc\_unit\_t* `adc_unit`, *adc\_channel\_t* `channel`)  
Initialize I2S ADC mode.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `adc_unit`: ADC unit index
- `channel`: ADC channel index

void **adc1\_ulp\_enable** (void)

Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw` function.

Note that `adc1_config_channel_atten`, `adc1_config_width` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

int **hall\_sensor\_read** (void)

Read Hall Sensor.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling `adc1_config_width()` before calling `hall_sensor_read()`. ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

**Return** The hall sensor reading.

*esp\_err\_t* **adc2\_pad\_get\_io\_num** (*adc2\_channel\_t* channel, *gpio\_num\_t* \**gpio\_num*)

Get the GPIO number of a specific ADC2 channel.

**Return**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

**Parameters**

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

*esp\_err\_t* **adc2\_config\_channel\_atten** (*adc2\_channel\_t* channel, *adc\_atten\_t* atten)

Configure the ADC2 channel, including setting attenuation.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

When VDD\_A is 3.3 V:

- 0 dB attenuation (ADC\_ATTEN\_0db) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC\_ATTEN\_2\_5db) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC\_ATTEN\_6db) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC\_ATTEN\_11db) gives full-scale voltage 3.9 V (see note below)

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC2 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD\_A, not the full scale voltage.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

*esp\_err\_t* **adc2\_get\_raw** (*adc2\_channel\_t* channel, *adc\_bits\_width\_t* width\_bit, int \*raw\_out)

Take an ADC2 reading on a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with `ESP_ERR_TIMEOUT`.

**Return**

- `ESP_OK` if success
- `ESP_ERR_TIMEOUT` the WIFI is started, using the ADC2

**Parameters**

- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

*esp\_err\_t* **adc2\_vref\_to\_gpio** (*gpio\_num\_t* gpio)

Output ADC2 reference voltage to GPIO 25 or 26 or 27.

This function utilizes the testing mux exclusive to ADC 2 to route the reference voltage one of ADC2’s channels. Supported GPIOs are GPIOs 25, 26, and 27. This reference voltage can be manually read from the pin and used in the `esp_adc_cal` component.

**Return**

- `ESP_OK`: v\_ref successfully routed to selected GPIO
- `ESP_ERR_INVALID_ARG`: Unsupported GPIO

**Parameters**

- `[in] gpio`: GPIO number (GPIOs 25, 26 and 27 are supported)

**Macros**

`ADC_ATTEN_0db`

`ADC_ATTEN_2_5db`

`ADC_ATTEN_6db`

`ADC_ATTEN_11db`

`ADC_WIDTH_9Bit`

`ADC_WIDTH_10Bit`

`ADC_WIDTH_11Bit`

`ADC_WIDTH_12Bit`

**Enumerations**

`enum adc1_channel_t`

Values:

`ADC1_CHANNEL_0 = 0`

ADC1 channel 0 is GPIO36 (ESP32), GPIO1 (ESP32-S2)

`ADC1_CHANNEL_1`

**ADC\_CHANNEL\_MAX**

**enum adc\_atten\_t**

*Values:*

**ADC\_ATTEN\_DB\_0** = 0

The input voltage of ADC will be reduced to about 1/1

**ADC\_ATTEN\_DB\_2\_5** = 1

The input voltage of ADC will be reduced to about 1/1.34

**ADC\_ATTEN\_DB\_6** = 2

The input voltage of ADC will be reduced to about 1/2

**ADC\_ATTEN\_DB\_11** = 3

The input voltage of ADC will be reduced to about 1/3.6

**ADC\_ATTEN\_MAX**

**enum adc\_i2s\_source\_t**

*Values:*

**ADC\_I2S\_DATA\_SRC\_IO\_SIG** = 0

I2S data from GPIO matrix signal

**ADC\_I2S\_DATA\_SRC\_ADC = 1**  
I2S data from ADC

**ADC\_I2S\_DATA\_SRC\_MAX**

**enum adc\_bits\_width\_t**

*Values:*

**ADC\_WIDTH\_BIT\_9 = 0**  
ADC capture width is 9Bit

**ADC\_WIDTH\_BIT\_10 = 1**  
ADC capture width is 10Bit

**ADC\_WIDTH\_BIT\_11 = 2**  
ADC capture width is 11Bit

**ADC\_WIDTH\_BIT\_12 = 3**  
ADC capture width is 12Bit

**ADC\_WIDTH\_MAX**

## ADC Calibration

### Header File

- [esp\\_adc\\_cal/include/esp\\_adc\\_cal.h](#)

### Functions

*esp\_err\_t* **esp\_adc\_cal\_check\_efuse** (*esp\_adc\_cal\_value\_t* value\_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

#### Return

- **ESP\_OK**: The calibration mode is supported in eFuse
- **ESP\_ERR\_NOT\_SUPPORTED**: Error, eFuse values are not burned
- **ESP\_ERR\_INVALID\_ARG**: Error, invalid argument (**ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF**)

#### Parameters

- *value\_type*: Type of calibration value (**ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF** or **ESP\_ADC\_CAL\_VAL\_EFUSE\_TP**)

*esp\_adc\_cal\_value\_t* **esp\_adc\_cal\_characterize** (*adc\_unit\_t* adc\_num, *adc\_atten\_t* atten, *adc\_bits\_width\_t* bit\_width, *uint32\_t* default\_vref, *esp\_adc\_cal\_characteristics\_t* \*chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of  $[y = \text{coeff\_a} * x + \text{coeff\_b}]$ . Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** Two Point values and eFuse Vref can be enabled/disabled using menuconfig.

#### Return

- **ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF**: eFuse Vref used for characterization
- **ESP\_ADC\_CAL\_VAL\_EFUSE\_TP**: Two Point value used for characterization (only in Linear Mode)
- **ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF**: Default Vref used for characterization

#### Parameters

- [in] *adc\_num*: ADC to characterize (**ADC\_UNIT\_1** or **ADC\_UNIT\_2**)
- [in] *atten*: Attenuation to characterize
- [in] *bit\_width*: Bit width configuration of ADC

- [in] `default_vref`: Default ADC reference voltage in mV (used if eFuse values is not available)
- [out] `chars`: Pointer to empty structure used to store ADC characteristics

`uint32_t esp_adc_cal_raw_to_voltage` (`uint32_t adc_reading`, `const esp_adc_cal_characteristics_t *chars`)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC's characteristics.

**Note** Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return** Voltage in mV

#### Parameters

- [in] `adc_reading`: ADC reading
- [in] `chars`: Pointer to initialized structure containing ADC characteristics

`esp_err_t esp_adc_cal_get_voltage` (`adc_channel_t channel`, `const esp_adc_cal_characteristics_t *chars`, `uint32_t *voltage`)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

#### Return

- `ESP_OK`: ADC read and converted to mV
- `ESP_ERR_TIMEOUT`: Error, timed out attempting to read ADC
- `ESP_ERR_INVALID_ARG`: Error due to invalid arguments

#### Parameters

- [in] `channel`: ADC Channel to read
- [in] `chars`: Pointer to initialized ADC characteristics structure
- [out] `voltage`: Pointer to store converted voltage

## Structures

**struct** `esp_adc_cal_characteristics_t`

Structure storing characteristics of an ADC.

**Note** Call `esp_adc_cal_characterize()` to initialize the structure

## Public Members

`adc_unit_t` **adc\_num**

ADC number

`adc_atten_t` **atten**

ADC attenuation

`adc_bits_width_t` **bit\_width**

ADC bit width

`uint32_t` **coeff\_a**

Gradient of ADC-Voltage curve

`uint32_t` **coeff\_b**

Offset of ADC-Voltage curve

`uint32_t` **vref**

Vref used by lookup table

**const** `uint32_t *low_curve`

Pointer to low Vref curve of lookup table (NULL if unused)

**const uint32\_t \*high\_curve**

Pointer to high Vref curve of lookup table (NULL if unused)

### Enumerations

**enum esp\_adc\_cal\_value\_t**

Type of calibration value used in characterization.

*Values:*

**ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF = 0**

Characterization based on reference voltage stored in eFuse

**ESP\_ADC\_CAL\_VAL\_EFUSE\_TP = 1**

Characterization based on Two Point values stored in eFuse

**ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF = 2**

Characterization based on default reference voltage

## 2.3.2 Controller Area Network (CAN)

### Overview

The ESP32's peripherals contains a CAN Controller that supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID) of the CAN2.0B specification.

**Warning:** The ESP32 CAN controller is not compatible with CAN FD frames and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *Basic CAN Concepts*
2. *Signals Lines and Transceiver*
3. *Configuration*
4. *Driver Operation*
5. *Examples*

### Basic CAN Concepts

---

**Note:** The following section only covers the basic aspects of CAN. For full details, see the CAN2.0B specification

---

The CAN protocol is a multi-master, multi-cast communication protocol with error detection/signalling and inbuilt message prioritization. The CAN protocol is commonly used as a communication bus in automotive applications.

**Multi-master:** Any node in a CAN bus is allowed initiate the transfer of data.

**Multi-cast:** When a node transmits a message, all nodes are able to receive the message (broadcast). However some nodes can selective choose which messages to accept via the use of acceptance filtering (multi-cast).

**Error Detection and Signalling:** Every CAN node will constantly monitor the CAN bus. When any node detects an error, it will signal the error by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** If two nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID will win arbitration. All other nodes will become receivers ensuring there is at most one transmitter at any time.

**CAN Message Frames** The CAN2.0B specification contains two frame formats known as **Extended Frame** and **Standard Frame** which contain 29-bit IDs and 11-bit IDs respectively. A CAN message consists of the following components

- 29-bit or 11-bit ID
- Data Length Code (DLC) between 0 to 8
- Up to 8 bytes of data (should match DLC)

**Error States and Counters** The CAN2.0B specification implements fault confinement by requiring every CAN node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are used to determine a CAN node's **error state**, and the counters are incremented and decremented following a set of rules (see CAN2.0B specification). These error states are known as **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A CAN node is Error Active when **both TEC and REC are less than 128** and indicates a CAN node is operating normally. Error Active nodes are allowed to participate in CAN bus activities, and will actively signal any error conditions it detects by transmitting an **Active Error Flag** over the CAN bus.

**Error Passive:** A CAN node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in CAN bus activities, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A CAN node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable take part in CAN bus activity and will remain so until it undergoes bus recovery.

### Signals Lines and Transceiver

The CAN controller does not contain a internal transceiver and therefore **requires an external transceiver** to operate. The type of external transceiver will depend on the application's physical layer specification (e.g. using SN65HVD23X transceivers for ISO 11898-2 compatibility).

The CAN controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to GPIOs.

**TX and RX:** The TX and RX signal lines are required to interface with an external CAN transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the CAN controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the CAN controller's source clock (APB Clock).

---

**Note:** An external transceiver **must internally tie the TX input and the RX output** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the CAN controller to interpret differences in logic levels between the two signal lines as a lost in arbitration or a bit error.

---

### Configuration

**Operating Modes** The CAN driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the CAN controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another CAN node is required when transmitting message frames.

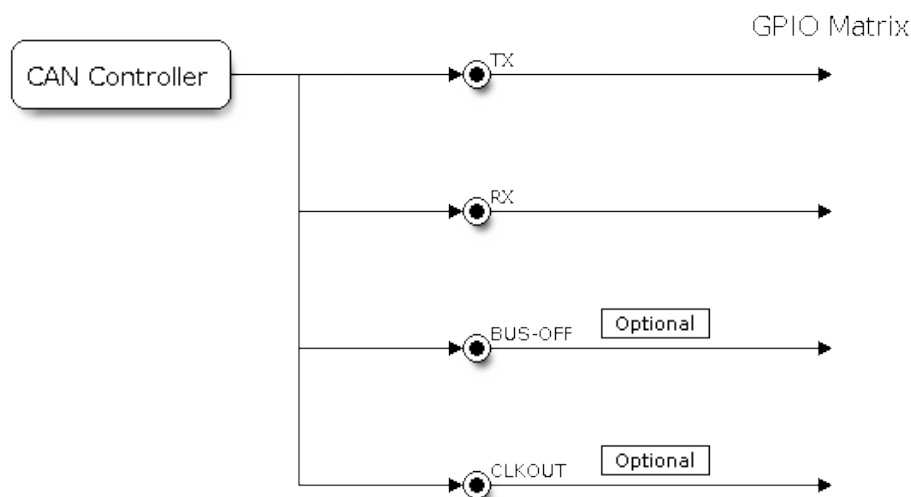

Fig. 7: Signal lines of the CAN controller

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required when transmitting message frames. This mode is useful when self testing the CAN controller.

**Listen Only Mode:** This mode will prevent the CAN controller from taking part in bus activities. Therefore transmissions of messages/acknowledgement/error frames will be disabled. However the the CAN controller will still be able to receive messages (without acknowledging). This mode is suited for applications such as CAN bus monitoring.

**Alerts** The CAN driver contains an alert feature which is used to notify the application level of certain CAN driver events. Alerts are selectively enabled when the CAN driver is installed, but can be reconfigured during runtime by calling `can_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `can_read_alerts()`. The CAN driver supports the following alerts:

Alert	Description
CAN_ALERT_TX_IDLE	No more messages queued for transmission
CAN_ALERT_TX_SUCCESS	The previous transmission was successful
CAN_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
CAN_ALERT_ERR_ACTIVE	CAN controller has become error active
CAN_ALERT_RECOVERY_IN_PROGRESS	CAN controller is undergoing bus recovery
CAN_ALERT_BUS_RECOVERED	CAN controller has successfully completed bus recovery
CAN_ALERT_ARB_LOST	The previous transmission lost arbitration
CAN_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
CAN_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
CAN_ALERT_TX_FAILED	The previous transmission has failed
CAN_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
CAN_ALERT_ERR_PASS	CAN controller has become error passive
CAN_ALERT_BUS_OFF	Bus-off condition occurred. CAN controller can no longer influence bus

**Note:** The **error warning limit** can be used to preemptively warn the application of bus errors before the error passive state is reached. By default the CAN driver sets the **error warning limit** to **96**. The `CAN_ALERT_ABOVE_ERR_WARN` is raised when the TEC or REC becomes larger then or equal to the error warning limit. The `CAN_ALERT_BELOW_ERR_WARN` is raised when both TEC and REC return back to values below

---

**Note:** When enabling alerts, the `CAN_ALERT_AND_LOG` flag can be used to cause the CAN driver to log any raised alerts to UART. However, alert logging is disabled and `CAN_ALERT_AND_LOG` if the `CONFIG_CAN_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

---

**Note:** The `CAN_ALERT_ALL` and `CAN_ALERT_NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

---

**Bit Timing** The operating bit rate of the CAN controller is configured using the `can_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quanta** is determined by a prescaled version of the CAN controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quanta
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quanta by dividing the CAN controller's source clock (80 MHz APB clock). The `brp` can be **any even number from 2 to 128**. If the ESP32 is a revision 2 or later chip, the `brp` will also support **any multiple of 4 from 132 to 256**, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

Fig. 8: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their CAN bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used CAN bus bit rates. The following macro initializers are provided by the CAN driver.

- `CAN_TIMING_CONFIG_12_5KBITS ()`
- `CAN_TIMING_CONFIG_16KBITS ()`
- `CAN_TIMING_CONFIG_20KBITS ()`
- `CAN_TIMING_CONFIG_25KBITS ()`
- `CAN_TIMING_CONFIG_50KBITS ()`
- `CAN_TIMING_CONFIG_100KBITS ()`
- `CAN_TIMING_CONFIG_125KBITS ()`
- `CAN_TIMING_CONFIG_250KBITS ()`

- `CAN_TIMING_CONFIG_500KBITS()`
- `CAN_TIMING_CONFIG_800KBITS()`
- `CAN_TIMING_CONFIG_1MBITS()`

**Note:** The macro initializers for 12.5K, 16K, and 20K bit rates are only available for ESP32 revision 2 or later.

**Acceptance Filter** The CAN controller contains a hardware acceptance filter which can be used to filter CAN messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the CAN bus that are irrelevant to the CAN node in question. The CAN controller's acceptance filter is configured using two 32-bit values within `can_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the CAN controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

Fig. 9: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

Fig. 10: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `can_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the CAN driver.

**Placing ISR into IRAM** The CAN driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the CAN driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver' s RX queue.
- Load messages pending transmission from the driver' s TX queue and write them into the TX buffer.

To place the CAN driver' s ISR, users must do the following:

- Enable the `CONFIG_CAN_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `can_driver_install()`, the `intr_flags` member of `can_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_CAN_ISR_IN_IRAM` option is enabled, the CAN driver will no longer log any alerts (i.e., the `CAN_ALERT_AND_LOG` flag will not have any effect).

## Driver Operation

The CAN driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 11: State transition diagram of the CAN driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>can_driver_install()</code>
B	Stopped -> Uninstalled	<code>can_driver_uninstall()</code>
C	Stopped -> Running	<code>can_start()</code>
D	Running -> Stopped	<code>can_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off -> Uninstalled	<code>can_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>can_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of bus-free signal

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the CAN controller is powered OFF.

**Stopped:** In this state, the CAN controller is powered ON and the CAN driver has been installed. However the CAN controller will be unable to take part in any CAN bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the CAN controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the CAN controller will be able to transmit error frames upon detection of errors on the CAN bus.

**Bus-Off:** The bus-off state is automatically entered when the CAN controller' s Transmit Error Counter becomes greater than or equal to 256 (see CAN2.0B specification regarding error counter rules). The bus-off state indicates the occurrence of severe errors on the CAN bus or in the CAN controller. Whilst in the bus-off state, the CAN

controller will be unable to take part in any CAN bus activities. To exit the bus-off state, the CAN controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the CAN driver undergoes bus recovery. The CAN driver/controller will remain in the recovering state until the 128 occurrences of the bus-free signal (see CAN2.0B specification) is observed on the CAN bus.

**Message Flags** The CAN driver distinguishes different types of CAN messages by using the various bit field members of the `can_message_t` structure. These bit field members help distinguish whether a message is in standard or extended format, an RTR, and the type of transmission to use when transmitting such a message. These bit field members can also be toggled using the the `flags` member of `can_message_t` and the following message flags:

Flag	Description
CAN_MSG_FLAG_EXTID	Message is in Extended Frame Format (29bit ID)
CAN_MSG_FLAG_RTR	Message is a Remote Transmit Request
CAN_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.
CAN_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.
CAN_MSG_FLAG_DLC	Message ID Data length code is larger than 8. This will break compliance with CAN2.0B
CAN_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the CAN driver via the use of the various configuration structures, macro initializers, the `can_driver_install()` function, and the `can_start()` function.

```
#include "driver/gpio.h"
#include "driver/can.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    can_general_config_t g_config = CAN_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
↪NUM_22, CAN_MODE_NORMAL);
    can_timing_config_t t_config = CAN_TIMING_CONFIG_500KBITS();
    can_filter_config_t f_config = CAN_FILTER_CONFIG_ACCEPT_ALL();

    //Install CAN driver
    if (can_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start CAN driver
    if (can_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers are not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `can_message_t` type and `can_transmit()` function.

```
#include "driver/can.h"

...

//Configure message to transmit
can_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (can_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `can_message_t` type and `can_receive()` function.

```
#include "driver/can.h"

...

//Wait for message to be received
can_message_t message;
if (can_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read CAN driver alerts via the use of the `can_reconfigure_alerts()` and `can_read_alerts()` functions.

```
#include "driver/can.h"
```

(continues on next page)

(continued from previous page)

```

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = CAN_ALERT_ERR_PASS | CAN_ALERT_BUS_OFF;
if (can_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
can_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the CAN driver via the use of the `can_stop()` and `can_driver_uninstall()` functions.

```

#include "driver/can.h"

...

//Stop the CAN driver
if (can_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the CAN driver
if (can_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `can_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The CAN Network example demonstrates communication between two ESP32s using the CAN driver API. One CAN node acts as a network master initiate and ceasing the transfer of a data from another CAN node acting as a network slave. The example can be found via [peripherals/can/can\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the CAN driver's alert and bus recovery API. The example purposely introduces errors on the CAN bus to put the CAN controller into the Bus-Off state.

An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/can/can\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the CAN controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the CAN controller and the external transceiver are working correctly. The example can be found via [peripherals/can/can\\_self\\_test](#).

## API Reference

### Header File

- [soc/include/hal/can\\_types.h](#)

### Structures

#### **struct can\_message\_t**

Structure to store a CAN message.

#### **Note**

**Note** The flags member is deprecated

### Public Members

uint32\_t **extd** : 1

Extended Frame Format (29bit ID)

uint32\_t **rtr** : 1

Message is a Remote Transmit Request

uint32\_t **ss** : 1

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self** : 1

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp** : 1

Message's Data length code is larger than 8. This will break compliance with CAN2.0B.

uint32\_t **reserved** : 27

Reserved bits

uint32\_t **flags**

Alternate way to set message flags using message flag macros (see documentation)

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[CAN\_FRAME\_MAX\_DLC]

Data bytes (not relevant in RTR frame)

#### **struct can\_timing\_config\_t**

Structure for bit timing configuration of the CAN driver.

**Note** Macro initializers are available for this structure

### Public Members

uint32\_t **brp**

Baudrate prescaler (i.e., APB clock divider) can be any even number from 2 to 128. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

`uint8_t tseg_1`  
Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`  
Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`  
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`  
Enables triple sampling when the CAN controller samples a bit

`struct can_filter_config_t`  
Structure for acceptance filter configuration of the CAN driver (see documentation)

**Note** Macro initializers are available for this structure

### Public Members

`uint32_t acceptance_code`  
32-bit acceptance code

`uint32_t acceptance_mask`  
32-bit acceptance mask

`bool single_filter`  
Use Single Filter Mode (see documentation)

### Macros

`CAN_EXTD_ID_MASK`  
CAN2.0B Constants.  
Bit mask for 29 bit Extended Frame Format ID

`CAN_STD_ID_MASK`  
Bit mask for 11 bit Standard Frame Format ID

`CAN_FRAME_MAX_DLC`  
Max data bytes allowed in CAN2.0

`CAN_FRAME_EXTD_ID_LEN_BYTES`  
EFF ID requires 4 bytes (29bit)

`CAN_FRAME_STD_ID_LEN_BYTES`  
SFF ID requires 2 bytes (11bit)

`CAN_ERR_PASS_THRESH`  
Error counter threshold for error passive

### Enumerations

`enum can_mode_t`  
CAN Controller operating modes.

*Values:*

`CAN_MODE_NORMAL`  
Normal operating mode where CAN controller can send/receive/acknowledge messages

`CAN_MODE_NO_ACK`  
Transmission does not require acknowledgment. Use this mode for self testing

`CAN_MODE_LISTEN_ONLY`  
The CAN controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

## Header File

- [driver/include/driver/can.h](#)

## Functions

*esp\_err\_t* **can\_driver\_install** (**const** *can\_general\_config\_t* \*g\_config, **const** *can\_timing\_config\_t* \*t\_config, **const** *can\_filter\_config\_t* \*f\_config)

Install CAN driver.

This function installs the CAN driver using three configuration structures. The required memory is allocated and the CAN driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the CAN driver, call `can_driver_uninstall()` first

### Return

- `ESP_OK`: Successfully installed CAN driver
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_NO_MEM`: Insufficient memory
- `ESP_ERR_INVALID_STATE`: Driver is already installed

### Parameters

- [in] `g_config`: General configuration structure
- [in] `t_config`: Timing configuration structure
- [in] `f_config`: Filter configuration structure

*esp\_err\_t* **can\_driver\_uninstall** (void)

Uninstall the CAN driver.

This function uninstalls the CAN driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

### Return

- `ESP_OK`: Successfully uninstalled CAN driver
- `ESP_ERR_INVALID_STATE`: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t* **can\_start** (void)

Start the CAN driver.

This function starts the CAN driver, putting the CAN driver into the running state. This allows the CAN driver to participate in CAN bus activities such as transmitting/receiving messages. The RX queue is reset in this function, clearing any unread messages. This function can only be called when the CAN driver is in the stopped state.

### Return

- `ESP_OK`: CAN driver is now running
- `ESP_ERR_INVALID_STATE`: Driver is not in stopped state, or is not installed

*esp\_err\_t* **can\_stop** (void)

Stop the CAN driver.

This function stops the CAN driver, preventing any further message from being transmitted or received until `can_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the CAN driver is in the running state.

**Warning** A message currently being transmitted/received on the CAN bus will be ceased immediately. This may lead to other CAN nodes interpreting the unfinished message as an error.

### Return

- `ESP_OK`: CAN driver is now Stopped
- `ESP_ERR_INVALID_STATE`: Driver is not in running state, or is not installed

*esp\_err\_t* **can\_transmit** (**const** *can\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a CAN message.

This function queues a CAN message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it timesout. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the CAN driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

#### Return

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: CAN driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

#### Parameters

- [in] message: Message to transmit
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on the TX queue

*esp\_err\_t can\_receive (can\_message\_t \*message, TickType\_t ticks\_to\_wait)*

Receive a CAN message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### Return

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [out] message: Received message
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on RX queue

*esp\_err\_t can\_read\_alerts (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)*

Read CAN driver alerts.

This function will read the alerts raised by the CAN driver. If no alert has been when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

#### Return

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block for alert

*esp\_err\_t can\_reconfigure\_alerts (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)*

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### Return

- ESP\_OK: Alerts reconfigured

- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

**Parameters**

- [in] `alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- [out] `current_alerts`: Bit field of currently raised alerts. Set to NULL if unused

*esp\_err\_t* **can\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the CAN driver is in the bus-off state. Once initiated, the CAN driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the CAN bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS\_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: CAN driver is not in the bus-off state, or is not installed

*esp\_err\_t* **can\_get\_status\_info** (*can\_status\_info\_t* \**status\_info*)

Get current status information of the CAN driver.

**Return**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

**Parameters**

- [out] `status_info`: Status information

*esp\_err\_t* **can\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when `can_stop()` or `can_initiate_recovery()` is called.

**Return**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed or TX queue is disabled

*esp\_err\_t* **can\_clear\_receive\_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when `can_start()` is called.

**Return**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

**Structures**

**struct** `can_general_config_t`

Structure for general configuration of the CAN driver.

**Note** Macro initializers are available for this structure

**Public Members**

*can\_mode\_t* **mode**

Mode of CAN controller

*gpio\_num\_t* **tx\_io**

Transmit GPIO number

*gpio\_num\_t rx\_io*  
Receive GPIO number

*gpio\_num\_t clkout\_io*  
CLKOUT GPIO number (optional, set to -1 if unused)

*gpio\_num\_t bus\_off\_io*  
Bus off indicator GPIO number (optional, set to -1 if unused)

uint32\_t **tx\_queue\_len**  
Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32\_t **rx\_queue\_len**  
Number of messages RX queue can hold

uint32\_t **alerts\_enabled**  
Bit field of alerts to enable (see documentation)

uint32\_t **clkout\_divider**  
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr\_flags**  
Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

**struct can\_status\_info\_t**  
Structure to store status information of CAN driver.

### Public Members

*can\_state\_t state*  
Current state of CAN controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t **msgs\_to\_tx**  
Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**  
Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**  
Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**  
Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**  
Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**  
Number of messages that were lost due to a full RX queue

uint32\_t **arb\_lost\_count**  
Number of instances arbitration was lost

uint32\_t **bus\_error\_count**  
Number of instances a bus error has occurred

### Macros

**CAN\_IO\_UNUSED**  
Marks GPIO as unused in CAN configuration

### Enumerations

**enum can\_state\_t**

CAN driver states.

*Values:***CAN\_STATE\_STOPPED**

Stopped state. The CAN controller will not participate in any CAN bus activities

**CAN\_STATE\_RUNNING**

Running state. The CAN controller can transmit and receive messages

**CAN\_STATE\_BUS\_OFF**

Bus-off state. The CAN controller cannot participate in bus activities until it has recovered

**CAN\_STATE\_RECOVERING**

Recovering state. The CAN controller is undergoing bus recovery

### 2.3.3 Digital To Analog Converter

#### Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data, via the *I2S driver* when using the “built-in DAC mode” .

For other analog output options, see the *Sigma-delta Modulation module* and the *LED Control module*. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

#### Application Example

Setting DAC channel 1 (GPIO 25) voltage to approx 0.78 of VDD\_A voltage ( $VDD * 200 / 255$ ). For VDD\_A 3.3V, this is 2.59V:

```
#include <driver/dac.h>

...

dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

#### API Reference

##### Header File

- [driver/include/driver/dac.h](#)

##### Functions

*esp\_err\_t* **dac\_pad\_get\_io\_num** (*dac\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the gpio number of a specific DAC channel.

**Return**

- ESP\_OK if success

**Parameters**

- channel: Channel to get the gpio number
- gpio\_num: output buffer to hold the gpio number

*esp\_err\_t* **dac\_output\_voltage** (*dac\_channel\_t* channel, uint8\_t dac\_value)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3\_RTC.

**Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Return**

- ESP\_OK success

**Parameters**

- channel: DAC channel
- dac\_value: DAC output value

*esp\_err\_t* **dac\_output\_enable** (*dac\_channel\_t* channel)

DAC pad output enable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

**Parameters**

- channel: DAC channel

*esp\_err\_t* **dac\_output\_disable** (*dac\_channel\_t* channel)

DAC pad output disable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Return**

- ESP\_OK success

**Parameters**

- channel: DAC channel

*esp\_err\_t* **dac\_i2s\_enable** (void)

Enable DAC output data from I2S.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_i2s\_disable** (void)

Disable DAC output data from I2S.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_enable** (void)

Enable cosine wave generator output.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_disable** (void)

Disable cosine wave generator output.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_config** (*dac\_cw\_config\_t* \*cw)

Config the cosine wave generator function in DAC module.

**Return**

- ESP\_OK success

**Parameters**

- cw: Configuration.

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC\_CHANNEL\_1\_GPIO\_NUM is the GPIO number of channel 1 (25);
2. DAC\_GPIO26\_CHANNEL is the channel number of GPIO 26 (channel 2).

### Header File

- [soc/esp32/include/soc/dac\\_channel.h](#)

### Macros

**DAC\_GPIO25\_CHANNEL**  
**DAC\_CHANNEL\_1\_GPIO\_NUM**  
**DAC\_GPIO26\_CHANNEL**  
**DAC\_CHANNEL\_2\_GPIO\_NUM**

### Header File

- [soc/include/hal/dac\\_types.h](#)

### Structures

**struct dac\_cw\_config\_t**

Config the cosine wave generator function in DAC module.

#### Public Members

*dac\_channel\_t* **en\_ch**

Enable the cosine wave generator of DAC channel.

*dac\_cw\_scale\_t* **scale**

Set the amplitude of the cosine wave generator output.

*dac\_cw\_phase\_t* **phase**

Set the phase of the cosine wave generator output.

uint32\_t **freq**

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8\_t **offset**

Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

### Enumerations

**enum dac\_channel\_t**

*Values:*

**DAC\_CHANNEL\_1 = 0**

DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2BETA)

**DAC\_CHANNEL\_2 = 1**

DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2BETA)

**DAC\_CHANNEL\_MAX**

**enum dac\_cw\_scale\_t**

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3\_RTC.

*Values:*

**DAC\_CW\_SCALE\_1 = 0x0**

1/1. Default.

**DAC\_CW\_SCALE\_2 = 0x1**

1/2.

**DAC\_CW\_SCALE\_4 = 0x2**

1/4.

**DAC\_CW\_SCALE\_8** = 0x3  
1/8.

#### enum dac\_cw\_phase\_t

Set the phase of the cosine wave generator output.

Values:

**DAC\_CW\_PHASE\_0** = 0x2  
Phase shift +0°

**DAC\_CW\_PHASE\_180** = 0x3  
Phase shift +180°

## 2.3.4 GPIO & RTC GPIO

### Overview

The ESP32 chip features 40 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package (refer to technical reference manual). Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO6-11 are usually used for SPI flash.
- GPIO34-39 can only be set as input mode and do not have software pullup or pulldown functions.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when in deep sleep, when the *Ultra Low Power co-processor* is running, or when analog functions such as ADC/DAC/etc are in use.

### Application Example

GPIO output and input interrupt example: [peripherals/gpio](#).

### API Reference - Normal GPIO

#### Header File

- [driver/include/driver/gpio.h](#)

#### Functions

*esp\_err\_t* **gpio\_config** (**const** *gpio\_config\_t* \*pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- pGPIOConfig: Pointer to GPIO configure struct

*esp\_err\_t* **gpio\_reset\_pin** (*gpio\_num\_t* gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP\_OK.

#### Parameters

- gpio\_num: GPIO number.

*esp\_err\_t* **gpio\_set\_intr\_type** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- intr\_type: Interrupt type, select from gpio\_int\_type\_t

*esp\_err\_t* **gpio\_intr\_enable** (*gpio\_num\_t* gpio\_num)

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO module interrupt signal.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* gpio\_num, *uint32\_t* level)

GPIO set output level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

**Parameters**

- gpio\_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- level: Output level. 0: low ; 1: high

*int* **gpio\_get\_level** (*gpio\_num\_t* gpio\_num)

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**

- gpio\_num: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode`: GPIO direction

`esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)`

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull`: GPIO pull up/down mode.

`esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

Enable GPIO wake-up function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

`esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)`

Disable GPIO wake-up function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

`esp_err_t gpio_isr_register(void (*fn)) void *`

, void \*arg, int intr\_alloc\_flags, `gpio_isr_handle_t *handle` Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the [interrupt allocation functions](#).

**Parameters**

- `fn`: Interrupt handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `arg`: Parameter for handler function
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en(gpio_num_t gpio_num)`

Enable pull-up on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* `gpio_num`)

Disable pull-up on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_pulldown\_en** (*gpio\_num\_t* `gpio_num`)

Enable pull-down on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_pulldown\_dis** (*gpio\_num\_t* `gpio_num`)

Disable pull-down on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_install\_isr\_service** (*int* `intr_alloc_flags`)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

`void` **gpio\_uninstall\_isr\_service** (`void`)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* `gpio_num`, *gpio\_isr\_t* `isr_handler`, `void *args`)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number
- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* `gpio_num`)

Remove ISR handler for the corresponding GPIO pin.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* `strength`)

Set GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* `*strength`)

Get GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* `gpio_num`)

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

**Parameters**

- `gpio_num`: GPIO number, only support output-capable GPIOs

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* `gpio_num`)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by

default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

**Parameters**

- `gpio_num`: GPIO number, only support output-capable GPIOs

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pad hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t *gpio\_num*, uint32\_t *signal\_idx*)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the \*\_IN\_IDX signals in `soc/gpio_sig_map.h`.

void **gpio\_iomux\_out** (uint8\_t *gpio\_num*, int *func*, bool *oen\_inv*)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- `gpio_num`: `gpio_num` GPIO number of the pad.
- `func`: The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in `soc/io_mux_reg.h`.
- `oen_inv`: True if the output enable needs to be inverted, otherwise False.

**Type Definitions**

```
typedef intr_handle_t gpio_isr_handle_t
```

**Header File**

- `soc/include/hal/gpio_types.h`

**Structures**

```
struct gpio_config_t
```

Configuration parameters of GPIO pad for `gpio_config` function.

**Public Members**

GPIO interrupt type : falling edge

**GPIO\_INTR\_ANYEDGE** = 3  
GPIO interrupt type : both rising and falling edge

**GPIO\_INTR\_LOW\_LEVEL** = 4  
GPIO interrupt type : input low level trigger

**GPIO\_INTR\_HIGH\_LEVEL** = 5  
GPIO interrupt type : input high level trigger

**GPIO\_INTR\_MAX**

**enum gpio\_mode\_t**

*Values:*

**GPIO\_MODE\_DISABLE** = GPIO\_MODE\_DEF\_DISABLE  
GPIO mode : disable input and output

**GPIO\_MODE\_INPUT** = GPIO\_MODE\_DEF\_INPUT  
GPIO mode : input only

**GPIO\_MODE\_OUTPUT** = GPIO\_MODE\_DEF\_OUTPUT  
GPIO mode : output only mode

**GPIO\_MODE\_OUTPUT\_OD** = ((GPIO\_MODE\_DEF\_OUTPUT) | (GPIO\_MODE\_DEF\_OD))  
GPIO mode : output only with open-drain mode

**GPIO\_MODE\_INPUT\_OUTPUT\_OD** = ((GPIO\_MODE\_DEF\_INPUT) | (GPIO\_MODE\_DEF\_OUTPUT) | (GPIO\_MODE\_DEF\_OD))  
GPIO mode : output and input with open-drain mode

**GPIO\_MODE\_INPUT\_OUTPUT** = ((GPIO\_MODE\_DEF\_INPUT) | (GPIO\_MODE\_DEF\_OUTPUT))  
GPIO mode : output and input mode

**enum gpio\_pullup\_t**

*Values:*

**GPIO\_PULLUP\_DISABLE** = 0x0  
Disable GPIO pull-up resistor

**GPIO\_PULLUP\_ENABLE** = 0x1  
Enable GPIO pull-up resistor

**enum gpiopulldown\_t**

*Values:*

**GPIO\_PULLDOWN\_DISABLE** = 0x0  
Disable GPIO pull-down resistor

**GPIO\_PULLDOWN\_ENABLE** = 0x1  
Enable GPIO pull-down resistor

**enum gpio\_pull\_mode\_t**

*Values:*

**GPIO\_PULLUP\_ONLY**  
Pad pull up

**GPIO\_PULLDOWN\_ONLY**  
Pad pull down

**GPIO\_PULLUP\_PULLDOWN**  
Pad pull up + pull down

**GPIO\_FLOATING**  
Pad floating

**enum gpio\_drive\_cap\_t**

Values:

- GPIO\_DRIVE\_CAP\_0** = 0  
Pad drive capability: weak
- GPIO\_DRIVE\_CAP\_1** = 1  
Pad drive capability: stronger
- GPIO\_DRIVE\_CAP\_2** = 2  
Pad drive capability: medium
- GPIO\_DRIVE\_CAP\_DEFAULT** = 2  
Pad drive capability: medium
- GPIO\_DRIVE\_CAP\_3** = 3  
Pad drive capability: strongest
- GPIO\_DRIVE\_CAP\_MAX**

**API Reference - RTC GPIO****Header File**

- `driver/include/driver/rtc_io.h`

**Functions**

**static bool** `rtc_gpio_is_valid_gpio` (*gpio\_num\_t* gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Return** true if GPIO is valid for RTC GPIO use. false otherwise.

**Parameters**

- `gpio_num`: GPIO number

**static int** `rtc_io_number_get` (*gpio\_num\_t* gpio\_num)

Get RTC IO index number by gpio number.

**Return** >=0: Index of rtcio. -1 : The gpio is not rtcio.

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* `rtc_gpio_init` (*gpio\_num\_t* gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t* `rtc_gpio_deinit` (*gpio\_num\_t* gpio\_num)

Init a GPIO as digital GPIO.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*uint32\_t* `rtc_gpio_get_level` (*gpio\_num\_t* gpio\_num)

Get the RTC IO input level.

**Return**

- 1 High level

- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_set\_level (gpio\_num\_t gpio\_num, uint32\_t level)*

Set the RTC IO output level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)
- `level`: output level

*esp\_err\_t rtc\_gpio\_set\_direction (gpio\_num\_t gpio\_num, rtc\_gpio\_mode\_t mode)*

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)
- `mode`: GPIO direction

*esp\_err\_t rtc\_gpio\_set\_direction\_in\_sleep (gpio\_num\_t gpio\_num, rtc\_gpio\_mode\_t mode)*

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)
- `mode`: GPIO direction

*esp\_err\_t rtc\_gpio\_pullup\_en (gpio\_num\_t gpio\_num)*

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_pulldown\_en (gpio\_num\_t gpio\_num)*

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_pullup\_dis (gpio\_num\_t gpio\_num)*

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t rtc\_gpio\_pulldown\_dis (gpio\_num\_t gpio\_num)*

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t rtc\_gpio\_hold\_en (gpio\_num\_t gpio\_num)*

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t rtc\_gpio\_hold\_dis (gpio\_num\_t gpio\_num)*

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t rtc\_gpio\_isolate (gpio\_num\_t gpio\_num)*

Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`).

*esp\_err\_t rtc\_gpio\_force\_hold\_all (void)*

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* *gpio\_num*, *gpio\_drive\_cap\_t* *strength*)

Set RTC GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number, only support output GPIOs
- *strength*: Drive capability of the pad

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (*gpio\_num\_t* *gpio\_num*, *gpio\_drive\_cap\_t* \**strength*)

Get RTC GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number, only support output GPIOs
- *strength*: Pointer to accept drive capability of the pad

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (*gpio\_num\_t* *gpio\_num*, *gpio\_intr\_type\_t* *intr\_type*)

Enable wakeup from sleep mode using specific GPIO.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if *gpio\_num* is not an RTC IO, or *intr\_type* is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

**Parameters**

- *gpio\_num*: GPIO number
- *intr\_type*: Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (*gpio\_num\_t* *gpio\_num*)

Disable wakeup from sleep mode using specific GPIO.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if *gpio\_num* is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number

## Macros

**RTC\_GPIO\_IS\_VALID\_GPIO** (*gpio\_num*)

## Header File

- [soc/include/hal/rtc\\_io\\_types.h](#)

## Enumerations

**enum** **rtc\_gpio\_mode\_t**

RTCIO output/input mode type.

*Values:*

**RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

**RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

**RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

**RTC\_GPIO\_MODE\_DISABLED**

Pad (output + input) disable

**RTC\_GPIO\_MODE\_OUTPUT\_OD**

Pad open-drain output

**RTC\_GPIO\_MODE\_INPUT\_OUTPUT\_OD**

Pad input + open-drain output

## 2.3.5 I2C Driver

### Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on two I2C buses. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

### Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

### Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
  - a) *Communication as Master* - handle communications (master)
  - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver*- release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp32/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices. ESP32's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send *n* bytes to a slave.

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`
  - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
  - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
  - d) **Stop bit** - `i2c_master_stop()`Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read *n* bytes from a slave.

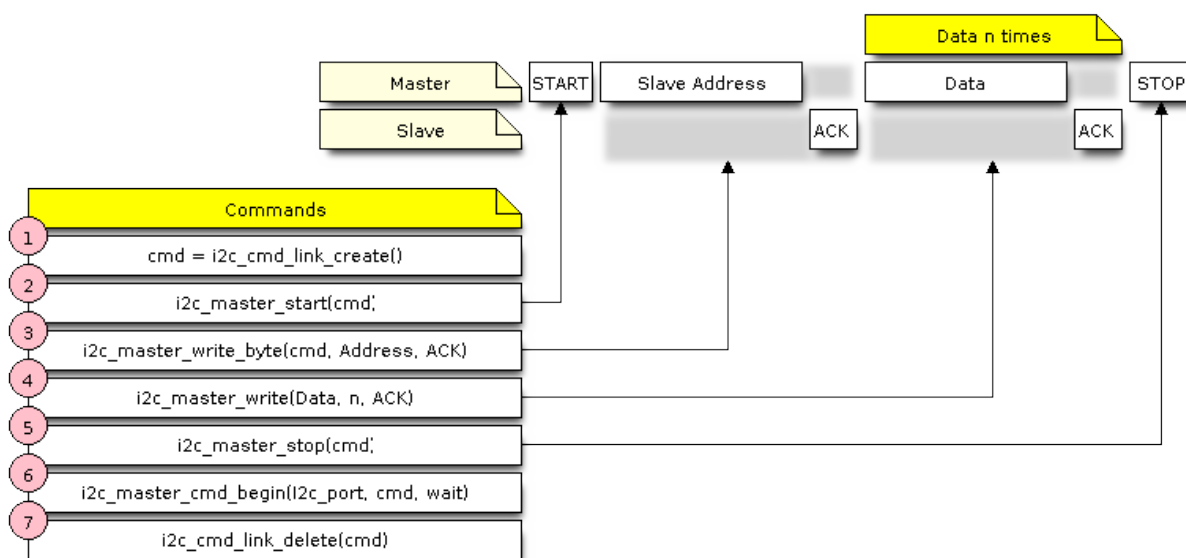

Fig. 12: I2C command link - master write example

Fig. 13: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave's address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`  
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
- `i2c_slave_write_buffer()`  
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

**Interrupt Handling** During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to the [ESP32 Technical Reference Manual](#) for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the [I2C specification](#). Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

Table 1: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of <b>start</b> signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

---

**Note:** ESP32's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the [I2C specification](#).

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

## Application Example

I2C master and slave example: [peripherals/i2c](#).

## API Reference

### Header File

- `driver/include/driver/i2c.h`

### Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** In master mode, if the cache is likely to be disabled(such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram(if psram is enabled) in interrupt handle function when cache is disabled.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver install error

**Parameters**

- `i2c_num`: I2C port number
- `mode`: I2C mode( master or slave )
- `slv_rx_buf_len`: receiving buffer size for slave mode

**Parameters**

- `slv_tx_buf_len`: sending buffer size for slave mode

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

`esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`

I2C driver delete.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

I2C parameter initialization.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `i2c_conf`: pointer to I2C parameter settings

`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`

reset I2C tx hardware fifo

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`

reset I2C rx fifo

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_isr_register(i2c_port_t i2c_num, void (*fn)) void *, void *arg, int intr_alloc_flags, intr_handle_t *handle` I2C isr handler register.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

- `fn`: isr handler function
- `arg`: parameter for isr handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: handle return from `esp_intr_alloc`.

*esp\_err\_t* **i2c\_isr\_free** (*intr\_handle\_t* handle)

to delete and free I2C isr.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `handle`: handle of isr.

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* i2c\_num, int sda\_io\_num, int scl\_io\_num, bool sda\_pullup\_en, bool scl\_pullup\_en, *i2c\_mode\_t* mode)

Configure GPIO signal for I2C sck and sda.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `sda_io_num`: GPIO number for I2C sda signal
- `scl_io_num`: GPIO number for I2C scl signal
- `sda_pullup_en`: Whether to enable the internal pullup for sda pin
- `scl_pullup_en`: Whether to enable the internal pullup for scl pin
- `mode`: I2C mode

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and init I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Return** i2c command link handler

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Parameters**

- `cmd_handle`: I2C command handle

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue command for I2C master to generate a start signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t data, bool ack\_en)

Queue command for I2C master to write one byte to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: I2C one byte command to write to bus
- `ack_en`: enable ack check for master

`esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, bool ack_en)`

Queue command for I2C master to write buffer to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: data to send

**Parameters**

- `data_len`: data length
- `ack_en`: enable ack check for master

`esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)`

Queue command for I2C master to read one byte from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: pointer accept the data byte

**Parameters**

- `ack`: ack value for read command

`esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)`

Queue command for I2C master to read data from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: data buffer to accept the data from bus

**Parameters**

- `data_len`: read data length
- `ack`: ack value for read command

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`

Queue command for I2C master to generate a stop signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

**Note** Only call this function in I2C master mode

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave doesn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

**Parameters**

- `i2c_num`: I2C port number
- `cmd_handle`: I2C command handler
- `ticks_to_wait`: maximum wait ticks.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, uint8_t *data, int size, TickType_t ticks_to_wait)`

I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- `ESP_FAIL(-1)` Parameter error
- Others( $\geq 0$ ) The number of data bytes that pushed to the I2C slave buffer.

**Parameters**

- `i2c_num`: I2C port number
- `data`: data pointer to write into internal buffer
- `size`: data size
- `ticks_to_wait`: Maximum waiting ticks

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`

I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- `ESP_FAIL(-1)` Parameter error
- Others( $\geq 0$ ) The number of data bytes that read from I2C slave buffer.

**Parameters**

- `i2c_num`: I2C port number
- `data`: data pointer to accept data from internal buffer
- `max_size`: Maximum data size to read
- `ticks_to_wait`: Maximum waiting ticks

`esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)`

set I2C master clock period

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `high_period`: clock cycle number during SCL is high level, `high_period` is a 14 bit value
- `low_period`: clock cycle number during SCL is low level, `low_period` is a 14 bit value

`esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)`

get I2C master clock period

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `high_period`: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- `low_period`: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

`esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)`

enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine broken. enable hardware filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow the SCL clock.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `cyc_num`: the APB cycles need to be filtered( $0 \leq cyc\_num \leq 7$ ). When the period of a pulse is less than  $cyc\_num * APB\_cycle$ , the I2C controller will ignore this pulse.

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`

disable filter on I2C bus

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master start signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- `hold_time`: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master start signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

`esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master stop signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number

- `setup_time`: clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- `hold_time`: clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

`esp_err_t i2c_get_stop_timing (i2c_port_t i2c_num, int *setup_time, int *hold_time)`  
get I2C master stop signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time.
- `hold_time`: pointer to get hold time.

`esp_err_t i2c_set_data_timing (i2c_port_t i2c_num, int sample_time, int hold_time)`  
set I2C data signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `sample_time`: clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- `hold_time`: clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

`esp_err_t i2c_get_data_timing (i2c_port_t i2c_num, int *sample_time, int *hold_time)`  
get I2C data signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `sample_time`: pointer to get sample time
- `hold_time`: pointer to get hold time

`esp_err_t i2c_set_timeout (i2c_port_t i2c_num, int timeout)`  
set I2C timeout value

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `timeout`: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

`esp_err_t i2c_get_timeout (i2c_port_t i2c_num, int *timeout)`  
get I2C timeout value

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `timeout`: pointer to get timeout value

`esp_err_t i2c_set_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)`  
set I2C data transfer mode

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `tx_trans_mode`: I2C sending data mode
- `rx_trans_mode`: I2C receiving data mode

`esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)`  
get I2C data transfer mode

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

**Macros****I2C\_APB\_CLK\_FREQ**

I2C source clock is APB clock, 80MHz

**I2C\_NUM\_0**

I2C port 0

**I2C\_NUM\_1**

I2C port 1

**I2C\_NUM\_MAX**

I2C port max

**Type Definitions**

`typedef void *i2c_cmd_handle_t`  
I2C command handle

**Header File**

- [soc/include/hal/i2c\\_types.h](#)

**Structures**

`struct i2c_config_t`  
I2C initialization parameters.

**Public Members**

`i2c_mode_t mode`  
I2C mode

int `sda_io_num`  
GPIO number for I2C sda signal

int `scl_io_num`  
GPIO number for I2C scl signal

bool `sda_pullup_en`  
Internal GPIO pull mode for I2C sda signal

bool `scl_pullup_en`  
Internal GPIO pull mode for I2C scl signal

`uint32_t clk_speed`  
I2C clock frequency for master mode, (no higher than 1MHz for now)

`uint8_t addr_10bit_en`  
I2C 10bit address mode enable for slave mode

`uint16_t slave_addr`  
I2C address for slave mode

### Type Definitions

**typedef** int `i2c_port_t`  
I2C port number, can be `I2C_NUM_0 ~ (I2C_NUM_MAX-1)`.

### Enumerations

**enum** `i2c_mode_t`

*Values:*

`I2C_MODE_SLAVE` = 0  
I2C slave mode

`I2C_MODE_MASTER`  
I2C master mode

`I2C_MODE_MAX`

**enum** `i2c_rw_t`

*Values:*

`I2C_MASTER_WRITE` = 0  
I2C write data

`I2C_MASTER_READ`  
I2C read data

**enum** `i2c_opmode_t`

*Values:*

`I2C_CMD_RESTART` = 0  
I2C restart command

`I2C_CMD_WRITE`  
I2C write command

`I2C_CMD_READ`  
I2C read command

`I2C_CMD_STOP`  
I2C stop command

`I2C_CMD_END`  
I2C end command

**enum** `i2c_trans_mode_t`

*Values:*

`I2C_DATA_MODE_MSB_FIRST` = 0  
I2C data msb first

`I2C_DATA_MODE_LSB_FIRST` = 1  
I2C data lsb first

`I2C_DATA_MODE_MAX`

**enum** `i2c_addr_mode_t`

*Values:*

**I2C\_ADDR\_BIT\_7** = 0  
I2C 7bit address for slave mode

**I2C\_ADDR\_BIT\_10**  
I2C 10bit address for slave mode

**I2C\_ADDR\_BIT\_MAX**

**enum i2c\_ack\_type\_t**

*Values:*

**I2C\_MASTER\_ACK** = 0x0  
I2C ack for each byte read

**I2C\_MASTER\_NACK** = 0x1  
I2C nack for each byte read

**I2C\_MASTER\_LAST\_NACK** = 0x2  
I2C nack for the last byte

**I2C\_MASTER\_ACK\_MAX**

**enum i2c\_sclk\_t**

*Values:*

**I2C\_SCLK\_REF\_TICK**  
I2C source clock from REF\_TICK

**I2C\_SCLK\_APB**  
I2C source clock from APB

## 2.3.6 I2S

### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 integrates two I2S controllers, referred to as I2S0 and I2S1, both of which can be used for streaming audio and video digital data.

An I2S bus consists of the following lines:

- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- Dedicated DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter's (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see the [ESP32 Technical Reference Manual](#).

**Note:** For high accuracy clock applications, use the APLL\_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL\_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll = TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true:  $0 < \text{MCLK/LRCK/channels/bits\_per\_sample} < 64$ .

## Functional Overview

**Installing the Driver** Install the I2S driver by calling the function `cpp:func`i2s_driver_install`` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Configuration example:

```
static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `cpp:func`i2s_set_pin`` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the I2S DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the I2S DMA Rx buffer, once the data is received by the I2S controller.

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func`i2s_driver_install`` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

### Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there are two short configuration examples for the I2S driver.

### I2S configuration

```
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↪driver

i2s_set_pin(i2s_num, &pin_config);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

## Configuring I2S to use internal DAC for analog output

```
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↳driver

i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the_
↳internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

## API Reference

### Header File

- [driver/include/driver/i2s.h](#)

### Functions

*esp\_err\_t* **i2s\_set\_pin** (*i2s\_port\_t* i2s\_num, **const** *i2s\_pin\_config\_t* \*pin)

Set I2S pin number.

Inside the pin configuration structure, set I2S\_PIN\_NO\_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

#### Parameters

- i2s\_num: I2S\_NUM\_0 or I2S\_NUM\_1
- pin: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if \*pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call i2s\_set\_dac\_mode instead.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL IO error

*esp\_err\_t* **i2s\_set\_dac\_mode** (*i2s\_dac\_mode\_t* *dac\_mode*)

Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *dac\_mode*: DAC mode configurations - see *i2s\_dac\_mode\_t*

*esp\_err\_t* **i2s\_driver\_install** (*i2s\_port\_t* *i2s\_num*, **const** *i2s\_config\_t* \**i2s\_config*, int *queue\_size*, void \**i2s\_queue*)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *i2s\_config*: I2S configurations - see *i2s\_config\_t* struct
- *queue\_size*: I2S event queue size/depth.
- *i2s\_queue*: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_driver\_uninstall** (*i2s\_port\_t* *i2s\_num*)

Uninstall I2S driver.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_write** (*i2s\_port\_t* *i2s\_num*, **const** void \**src*, size\_t *size*, size\_t \**bytes\_written*, TickType\_t *ticks\_to\_wait*)

Write data to I2S DMA transmit buffer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *src*: Source address to write from
- *size*: Size of data in bytes
- [out] *bytes\_written*: Number of bytes written, if timeout, the result will be less than the size passed in.
- *ticks\_to\_wait*: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

*esp\_err\_t* **i2s\_write\_expand** (*i2s\_port\_t* *i2s\_num*, **const** void \**src*, size\_t *size*, size\_t *src\_bits*, size\_t *aim\_bits*, size\_t \**bytes\_written*, TickType\_t *ticks\_to\_wait*)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see *i2s\_config\_t*).

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *src*: Source address to write from

- `size`: Size of data in bytes
- `src_bits`: Source audio bit
- `aim_bits`: Bit wanted, no more than 32, and must be greater than `src_bits`
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2s\_read**(*i2s\_port\_t* *i2s\_num*, void \**dest*, size\_t *size*, size\_t \**bytes\_read*, TickType\_t *ticks\_to\_wait*)

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call `i2s_adc_start` and `i2s_adc_stop` around the whole reading process, to prevent the data getting corrupted.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2s_num`: `I2S_NUM_0`, `I2S_NUM_1`
- `dest`: Destination address to read into
- `size`: Size of data in bytes
- `[out] bytes_read`: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- `ticks_to_wait`: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

*esp\_err\_t* **i2s\_set\_sample\_rates**(*i2s\_port\_t* *i2s\_num*, uint32\_t *rate*)

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and *i2s\_config\_t* configuration parameters (number of channels, `bits_per_sample`).

$$\text{bit\_clock} = \text{rate} * (\text{number of channels}) * \text{bits\_per\_sample}$$
**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` Out of memory

**Parameters**

- `i2s_num`: `I2S_NUM_0`, `I2S_NUM_1`
- `rate`: I2S sample rate (ex: 8000, 44100...)

*esp\_err\_t* **i2s\_stop**(*i2s\_port\_t* *i2s\_num*)

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2s_num`: `I2S_NUM_0`, `I2S_NUM_1`

*esp\_err\_t* **i2s\_start** (*i2s\_port\_t* *i2s\_num*)

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_zero\_dma\_buffer** (*i2s\_port\_t* *i2s\_num*)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_set\_clk** (*i2s\_port\_t* *i2s\_num*, *uint32\_t* *rate*, *i2s\_bits\_per\_sample\_t* *bits*, *i2s\_channel\_t* *ch*)

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *rate*: I2S sample rate (ex: 8000, 44100...)
- *bits*: I2S bit width (I2S\_BITS\_PER\_SAMPLE\_16BIT, I2S\_BITS\_PER\_SAMPLE\_24BIT, I2S\_BITS\_PER\_SAMPLE\_32BIT)
- *ch*: I2S channel, (I2S\_CHANNEL\_MONO, I2S\_CHANNEL\_STEREO)

float **i2s\_get\_clk** (*i2s\_port\_t* *i2s\_num*)

get clock set on particular port number.

**Return**

- actual clock set by i2s driver

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_set\_adc\_mode** (*adc\_unit\_t* *adc\_unit*, *adc1\_channel\_t* *adc\_channel*)

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *adc\_unit*: SAR ADC unit index
- *adc\_channel*: ADC channel index

*esp\_err\_t* **i2s\_adc\_enable** (*i2s\_port\_t* *i2s\_num*)

Start to use I2S built-in ADC mode.

**Note** This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

- `ESP_ERR_INVALID_STATE` Driver state error

**Parameters**

- `i2s_num`: i2s port index

`esp_err_t i2s_adc_disable(i2s_port_t i2s_num)`

Stop to use I2S built-in ADC mode.

**Note** This function would release the lock of ADC so that other tasks can use ADC.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver state error

**Parameters**

- `i2s_num`: i2s port index

**Type Definitions**

```
typedef intr_handle_t i2s_isr_handle_t
```

**Header File**

- `soc/include/hal/i2s_types.h`

**Structures**

```
struct i2s_config_t
```

I2S configuration parameters for `i2s_param_config` function.

**Public Members**

`i2s_mode_t mode`

I2S work mode

int `sample_rate`

I2S sample rate

`i2s_bits_per_sample_t bits_per_sample`

I2S bits per sample

`i2s_channel_fmt_t channel_format`

I2S channel format

`i2s_comm_format_t communication_format`

I2S communication format

int `intr_alloc_flags`

Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info

int `dma_buf_count`

I2S DMA Buffer Count

int `dma_buf_len`

I2S DMA Buffer Length

bool `use_apll`

I2S using APLL as main I2S clock, enable it to get accurate clock

bool `tx_desc_auto_clear`

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int **fixed\_mclk**

I2S using fixed MCLK output. If `use_apll = true` and `fixed_mclk > 0`, then the clock output for i2s is fixed and equal to the `fixed_mclk` value.

**struct i2s\_event\_t**

Event structure used in I2S event queue.

### Public Members

*i2s\_event\_type\_t* **type**

I2S event type

size\_t **size**

I2S data size for I2S\_DATA event

**struct i2s\_pin\_config\_t**

I2S pin number for `i2s_set_pin`.

### Public Members

int **bck\_io\_num**

BCK in out pin

int **ws\_io\_num**

WS in out pin

int **data\_out\_num**

DATA out pin

int **data\_in\_num**

DATA in pin

### Macros

**I2S\_PIN\_NO\_CHANGE**

Use in *i2s\_pin\_config\_t* for pins which should not be changed

### Type Definitions

**typedef int i2s\_port\_t**

I2S port number, the max port number is (I2S\_NUM\_MAX - 1).

### Enumerations

**enum i2s\_bits\_per\_sample\_t**

I2S bit width per sample.

*Values:*

**I2S\_BITS\_PER\_SAMPLE\_8BIT** = 8

I2S bits per sample: 8-bits

**I2S\_BITS\_PER\_SAMPLE\_16BIT** = 16

I2S bits per sample: 16-bits

**I2S\_BITS\_PER\_SAMPLE\_24BIT** = 24

I2S bits per sample: 24-bits

**I2S\_BITS\_PER\_SAMPLE\_32BIT** = 32

I2S bits per sample: 32-bits

**enum i2s\_channel\_t**

I2S channel.

*Values:*

**I2S\_CHANNEL\_MONO** = 1  
I2S 1 channel (mono)

**I2S\_CHANNEL\_STEREO** = 2  
I2S 2 channel (stereo)

**enum i2s\_comm\_format\_t**  
I2S communication standard format.

*Values:*

**I2S\_COMM\_FORMAT\_I2S** = 0x01  
I2S communication format I2S

**I2S\_COMM\_FORMAT\_I2S\_MSB** = 0x02  
I2S format MSB

**I2S\_COMM\_FORMAT\_I2S\_LSB** = 0x04  
I2S format LSB

**I2S\_COMM\_FORMAT\_PCM** = 0x08  
I2S communication format PCM

**I2S\_COMM\_FORMAT\_PCM\_SHORT** = 0x10  
PCM Short

**I2S\_COMM\_FORMAT\_PCM\_LONG** = 0x20  
PCM Long

**enum i2s\_channel\_fmt\_t**  
I2S channel format type.

*Values:*

**I2S\_CHANNEL\_FMT\_RIGHT\_LEFT** = 0x00

**I2S\_CHANNEL\_FMT\_ALL\_RIGHT**

**I2S\_CHANNEL\_FMT\_ALL\_LEFT**

**I2S\_CHANNEL\_FMT\_ONLY\_RIGHT**

**I2S\_CHANNEL\_FMT\_ONLY\_LEFT**

**enum pdm\_sample\_rate\_ratio\_t**  
PDM sample rate ratio, measured in Hz.

*Values:*

**PDM\_SAMPLE\_RATE\_RATIO\_64**

**PDM\_SAMPLE\_RATE\_RATIO\_128**

**enum pdm\_pcm\_conv\_t**  
PDM PCM converter enable/disable.

*Values:*

**PDM\_PCM\_CONV\_ENABLE**

**PDM\_PCM\_CONV\_DISABLE**

**enum i2s\_mode\_t**  
I2S Mode, default is I2S\_MODE\_MASTER | I2S\_MODE\_TX.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

**I2S\_MODE\_MASTER** = 1

**I2S\_MODE\_SLAVE** = 2

**I2S\_MODE\_TX** = 4

**I2S\_MODE\_RX** = 8

**I2S\_MODE\_DAC\_BUILT\_IN** = 16

Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

**I2S\_MODE\_ADC\_BUILT\_IN** = 32

Input I2S data from built-in ADC, each data can be 12-bit width at most

**enum i2s\_event\_type\_t**

I2S event types.

*Values:*

**I2S\_EVENT\_DMA\_ERROR**

**I2S\_EVENT\_TX\_DONE**

I2S DMA finish sent 1 buffer

**I2S\_EVENT\_RX\_DONE**

I2S DMA finish received 1 buffer

**I2S\_EVENT\_MAX**

I2S event max index

**enum i2s\_dac\_mode\_t**

I2S DAC mode for `i2s_set_dac_mode`.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

**I2S\_DAC\_CHANNEL\_DISABLE** = 0

Disable I2S built-in DAC signals

**I2S\_DAC\_CHANNEL\_RIGHT\_EN** = 1

Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

**I2S\_DAC\_CHANNEL\_LEFT\_EN** = 2

Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

**I2S\_DAC\_CHANNEL\_BOTH\_EN** = 0x3

Enable both of the I2S built-in DAC channels.

**I2S\_DAC\_CHANNEL\_MAX** = 0x4

I2S built-in DAC mode max index

**enum i2s\_clock\_src\_t**

*Values:*

**I2S\_CLK\_D2CLK** = 0

**I2S\_CLK\_APLL**

## 2.3.7 LED Control

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes as well. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

A half of LEDC's channels operate in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other half of channels operate in low speed mode, where the moment of change depends on the application software. Each group of channels is also able to use different clock sources, but this feature is not yet supported in the LEDC driver.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Getting LEDC to work on a specific channel in either *high or low speed mode* is done in three steps:

1. *Configure Timer* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Configure Channel* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on the fade end.

Fig. 14: Key Settings of LED PWM Controller's API

**Configure Timer** Setting the timer is done by calling the function `ledc_timer_config()` and passing to it a data structure `ledc_timer_config_t` that contains the following configuration settings:

- Timer number `ledc_timer_t`
- Speed mode `ledc_mode_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower duty resolution is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

**Configure Channel** When the timer is set up, configure a selected channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Configure Channel](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2^{**} \text{duty\_resolution}) - 1$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a “clean” startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

## LEDC High and Low Speed Mode

Of the total 8 timers and 16 channels available in the LED PWM Controller, half of them are dedicated to operation in high speed mode and the other half in low speed mode. Selection of a low or high speed timer or channel is done with the parameter `ledc_mode_t` that can be found in applicable function calls.

The advantage of high speed mode is hardware-supported, glitch-free changeover of the timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, refer to [ESP32 Technical Reference Manual \(PDF\)](#). Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

## Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a wide resolution for PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. It means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

## Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc](#).

## API Reference

### Header File

- [driver/include/driver/ledc.h](#)

**Functions**

*esp\_err\_t* **ledc\_channel\_config** (const *ledc\_channel\_config\_t* \**ledc\_conf*)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *ledc\_conf*: Pointer of LEDC channel configure struct

*esp\_err\_t* **ledc\_timer\_config** (const *ledc\_timer\_config\_t* \**timer\_conf*)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

**Parameters**

- *timer\_conf*: Pointer of LEDC timer configure struct

*esp\_err\_t* **ledc\_update\_duty** (*ledc\_mode\_t* *speed\_mode*, *ledc\_channel\_t* *channel*)

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *speed\_mode*: Select the LEDC *speed\_mode*, high-speed mode and low-speed mode,
- *channel*: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_set\_pin** (int *gpio\_num*, *ledc\_mode\_t* *speed\_mode*, *ledc\_channel\_t* *ledc\_channel*)

Set LEDC output gpio.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: The LEDC output gpio
- *speed\_mode*: Select the LEDC *speed\_mode*, high-speed mode and low-speed mode
- *ledc\_channel*: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* *speed\_mode*, *ledc\_channel\_t* *channel*, uint32\_t *idle\_level*)

LEDC stop. Disable LEDC output, and set idle level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *speed\_mode*: Select the LEDC *speed\_mode*, high-speed mode and low-speed mode
- *channel*: LEDC channel (0-7), select from `ledc_channel_t`
- *idle\_level*: Set output idle level after LEDC stops.

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* *speed\_mode*, *ledc\_timer\_t* *timer\_num*, uint32\_t *freq\_hz*)

LEDC set channel frequency (Hz)

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- timer\_num: LEDC timer index (0-3), select from ledc\_timer\_t
- freq\_hz: Set the LEDC frequency

uint32\_t **ledc\_get\_freq** (*ledc\_mode\_t speed\_mode, ledc\_timer\_t timer\_num*)  
LEDC get channel frequency (Hz)

**Return**

- 0 error
- Others Current LEDC frequency

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- timer\_num: LEDC timer index (0-3), select from ledc\_timer\_t

*esp\_err\_t* **ledc\_set\_duty\_with\_hpoint** (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t duty, uint32\_t hpoint*)

LEDC set duty and hpoint value Only after calling ledc\_update\_duty will the duty update.

**Note** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc\_channel\_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- hpoint: Set the LEDC hpoint value(max: 0xffff)

int **ledc\_get\_hpoint** (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel*)  
LEDC get hpoint value, the counter value when the output is set high level.

**Return**

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc\_channel\_t

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t duty*)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc\_set\_duty\_with\_hpoint. only after calling ledc\_update\_duty will the duty update.

**Note** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc\_channel\_t

- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$

`uint32_t ledc_get_duty` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

#### Return

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* `ledc_set_fade` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` duty, *ledc\_duty\_direction\_t* fade\_direction, `uint32_t` step\_num, `uint32_t` duty\_cycle\_num, `uint32_t` duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the start of the gradient duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- `fade_direction`: Set the direction of the gradient
- `step_num`: Set the number of the gradient
- `duty_cycle_num`: Set how many LEDC tick each time the gradient lasts
- `duty_scale`: Set gradient change amplitude

*esp\_err\_t* `ledc_isr_register` (void (\*fn)) void \*

, void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

#### Parameters

- `fn`: Interrupt handler function.
- `arg`: User-supplied argument passed to the handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

*esp\_err\_t* `ledc_timer_set` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, `uint32_t` clock\_divider, `uint32_t` duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### Return

- (-1) Parameter error
- Other Current LEDC duty

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider`: Timer clock divide value, the timer clock is divided from the selected clock source
- `duty_resolution`: Resolution of duty setting in number of bits. The range of duty values is  $[0, (2^{**}duty\_resolution)]$

- `clk_src`: Select LEDC source clock.

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *uint32\_t* target\_duty, *uint32\_t* scale, *uint32\_t* cycle\_num)

Set LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`

- `target_duty`: Target duty of fading  $[0, (2^{**}duty\_resolution) - 1]$
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

#### Parameters

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading.  $(0 - (2^{**} duty\_resolution - 1))$
- `max_fade_time_ms`: The maximum time of the fading ( ms ).

*esp\_err\_t* **ledc\_fade\_func\_install** (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function already installed.

#### Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`ORred`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void **ledc\_fade\_func\_uninstall** (void)

Uninstall LEDC fade function.

*esp\_err\_t* **ledc\_fade\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

#### Parameters

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

#### Parameters

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- `hpoint`: Set the LEDC hpoint value(max: 0xffff)

`esp_err_t ledc_set_fade_time_and_start` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`,  
`uint32_t target_duty`, `uint32_t max_fade_time_ms`,  
`ledc_fade_mode_t fade_mode`)

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

#### Parameters

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading.  $(0 - (2^{**} duty\_resolution - 1))$
- `max_fade_time_ms`: The maximum time of the fading ( ms ).
- `fade_mode`: choose blocking or non-blocking mode

`esp_err_t ledc_set_fade_step_and_start` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`,  
`uint32_t target_duty`, `uint32_t scale`, `uint32_t cycle_num`,  
`ledc_fade_mode_t fade_mode`)

A thread-safe API to set and start LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

#### Parameters

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading  $[0, (2^{**}duty\_resolution) - 1]$
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles
- `fade_mode`: choose blocking or non-blocking mode

`LEDC_ERR_DUTY`

`LEDC_ERR_VAL`

#### Type Definitions

`typedef intr_handle_t ledc_isr_handle_t`

## Header File

- [soc/include/hal/ledc\\_types.h](#)

## Structures

**struct ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for `ledc_channel_config` function.

### Public Members

int **gpio\_num**

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - 7)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - 3)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is  $[0, (2^{**duty\_resolution})]$

int **hpoint**

LEDC channel `hpoint` value, the max value is `0xffff`

**struct ledc\_timer\_config\_t**

Configuration parameters of LEDC Timer `timer` for `ledc_timer_config` function.

### Public Members

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode or low-speed mode

*ledc\_timer\_bit\_t* **duty\_resolution**

LEDC channel duty resolution

*ledc\_timer\_bit\_t* **bit\_num**

Deprecated in ESP-IDF 3.0. This is an alias to ‘`duty_resolution`’ for backward compatibility with ESP-IDF 2.1

*ledc\_timer\_t* **timer\_num**

The timer source of channel (0 - 3)

uint32\_t **freq\_hz**

LEDC timer frequency (Hz)

*ledc\_clk\_cfg\_t* **clk\_cfg**

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`

## Enumerations

**enum ledc\_mode\_t**

Values:

**LEDC\_LOW\_SPEED\_MODE**  
LEDC low speed speed\_mode

**LEDC\_SPEED\_MODE\_MAX**  
LEDC speed limit

**enum ledc\_intr\_type\_t**

*Values:*

**LEDC\_INTR\_DISABLE = 0**  
Disable LEDC interrupt

**LEDC\_INTR\_FADE\_END**  
Enable LEDC interrupt

**LEDC\_INTR\_MAX**

**enum ledc\_duty\_direction\_t**

*Values:*

**LEDC\_DUTY\_DIR\_DECREASE = 0**  
LEDC duty decrease direction

**LEDC\_DUTY\_DIR\_INCREASE = 1**  
LEDC duty increase direction

**LEDC\_DUTY\_DIR\_MAX**

**enum ledc\_slow\_clk\_sel\_t**

*Values:*

**LEDC\_SLOW\_CLK\_RTC8M = 0**  
LEDC low speed timer clock source is 8MHz RTC clock

**LEDC\_SLOW\_CLK\_APB**  
LEDC low speed timer clock source is 80MHz APB clock

**enum ledc\_clk\_cfg\_t**

*Values:*

**LEDC\_AUTO\_CLK = 0**  
The driver will automatically select the source clock(REF\_TICK or APB) based on the giving resolution and duty parameter when init the timer

**LEDC\_USE\_REF\_TICK**  
LEDC timer select REF\_TICK clock as source clock

**LEDC\_USE\_APB\_CLK**  
LEDC timer select APB clock as source clock

**LEDC\_USE\_RTC8M\_CLK**  
LEDC timer select RTC8M\_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

**enum ledc\_clk\_src\_t**

*Values:*

**LEDC\_REF\_TICK = LEDC\_USE\_REF\_TICK**  
LEDC timer clock divided from reference tick (1Mhz)

**LEDC\_APB\_CLK = LEDC\_USE\_APB\_CLK**  
LEDC timer clock divided from APB clock (80Mhz)

**enum ledc\_timer\_t**

*Values:*

**LEDC\_TIMER\_0 = 0**  
LEDC timer 0

**LEDC\_TIMER\_1**  
LEDC timer 1

**LEDC\_TIMER\_2**  
LEDC timer 2

**LEDC\_TIMER\_3**  
LEDC timer 3

**LEDC\_TIMER\_MAX**

**enum ledc\_channel\_t**

*Values:*

**LEDC\_CHANNEL\_0** = 0  
LEDC channel 0

**LEDC\_CHANNEL\_1**  
LEDC channel 1

**LEDC\_CHANNEL\_2**  
LEDC channel 2

**LEDC\_CHANNEL\_3**  
LEDC channel 3

**LEDC\_CHANNEL\_4**  
LEDC channel 4

**LEDC\_CHANNEL\_5**  
LEDC channel 5

**LEDC\_CHANNEL\_6**  
LEDC channel 6

**LEDC\_CHANNEL\_7**  
LEDC channel 7

**LEDC\_CHANNEL\_MAX**

**enum ledc\_timer\_bit\_t**

*Values:*

**LEDC\_TIMER\_1\_BIT** = 1  
LEDC PWM duty resolution of 1 bits

**LEDC\_TIMER\_2\_BIT**  
LEDC PWM duty resolution of 2 bits

**LEDC\_TIMER\_3\_BIT**  
LEDC PWM duty resolution of 3 bits

**LEDC\_TIMER\_4\_BIT**  
LEDC PWM duty resolution of 4 bits

**LEDC\_TIMER\_5\_BIT**  
LEDC PWM duty resolution of 5 bits

**LEDC\_TIMER\_6\_BIT**  
LEDC PWM duty resolution of 6 bits

**LEDC\_TIMER\_7\_BIT**  
LEDC PWM duty resolution of 7 bits

**LEDC\_TIMER\_8\_BIT**  
LEDC PWM duty resolution of 8 bits

**LEDC\_TIMER\_9\_BIT**  
LEDC PWM duty resolution of 9 bits

**LEDC\_TIMER\_10\_BIT**  
LEDC PWM duty resolution of 10 bits

**LEDC\_TIMER\_11\_BIT**  
LEDC PWM duty resolution of 11 bits

**LEDC\_TIMER\_12\_BIT**  
LEDC PWM duty resolution of 12 bits

**LEDC\_TIMER\_13\_BIT**  
LEDC PWM duty resolution of 13 bits

**LEDC\_TIMER\_14\_BIT**  
LEDC PWM duty resolution of 14 bits

**LEDC\_TIMER\_15\_BIT**  
LEDC PWM duty resolution of 15 bits

**LEDC\_TIMER\_16\_BIT**  
LEDC PWM duty resolution of 16 bits

**LEDC\_TIMER\_17\_BIT**  
LEDC PWM duty resolution of 17 bits

**LEDC\_TIMER\_18\_BIT**  
LEDC PWM duty resolution of 18 bits

**LEDC\_TIMER\_19\_BIT**  
LEDC PWM duty resolution of 19 bits

**LEDC\_TIMER\_20\_BIT**  
LEDC PWM duty resolution of 20 bits

**LEDC\_TIMER\_BIT\_MAX**

**enum ledc\_fade\_mode\_t**

*Values:*

**LEDC\_FADE\_NO\_WAIT = 0**  
LEDC fade function will return immediately

**LEDC\_FADE\_WAIT\_DONE**  
LEDC fade function will block until fading to the target duty

**LEDC\_FADE\_MAX**

### 2.3.8 MCPWM

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled `PWMxA` / `PWMxB`.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as `SYNC SIGNALS`, detect `FAULT SIGNALS` like motor overcurrent or overvoltage, as well as obtain feedback with `CAPTURE SIGNALS` on e.g. a rotor position.

Description of this API starts with configuration of MCPWM's **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture**, **Carrier** and **Interrupts**.

#### Contents

- [Configure](#) a basic functionality of the outputs

Fig. 15: MCPWM Overview

Fig. 16: MCPWM Block Diagram

- *Operate* the outputs to drive a motor
- *Adjust* how the motor is driven
- *Capture* external signals to provide additional control over the outputs
- Use *Fault Handler* to detect and manage faults
- Add a higher frequency *Carrier*, if output signals are passed through an isolation transformer
- Configuration and handling of *Interrupts*.

### Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM's resources. An example circuit is shown below. It includes a [H-Bridge](#) to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

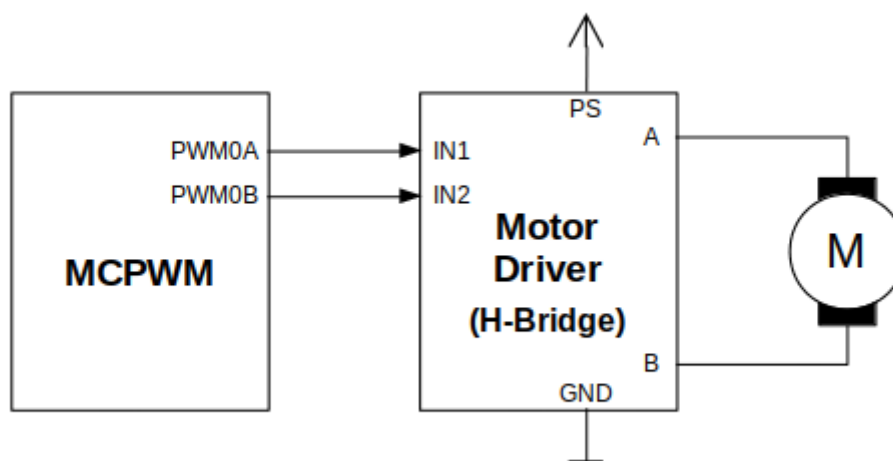

Fig. 17: Example of Brushed DC Motor Control with MCPWM

Configuration covers the following steps:

1. Selection of a MPWn unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

### Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit's outputs. The outputs are organized into three pairs. Within a pair they are labeled "A" and "B" and each driven by a submodule called an "Generator". To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM's duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section [Configure](#), and selecting one of options from `mcpwm_duty_type_t`.

---

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

---

## Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the [block diagram](#) of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_enable()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

---

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_enable()` or `mcpwm_sync_disable()`.

---

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section [Configure](#), and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated please refer to [ESP32 Technical Reference Manual](#).

## Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal's edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

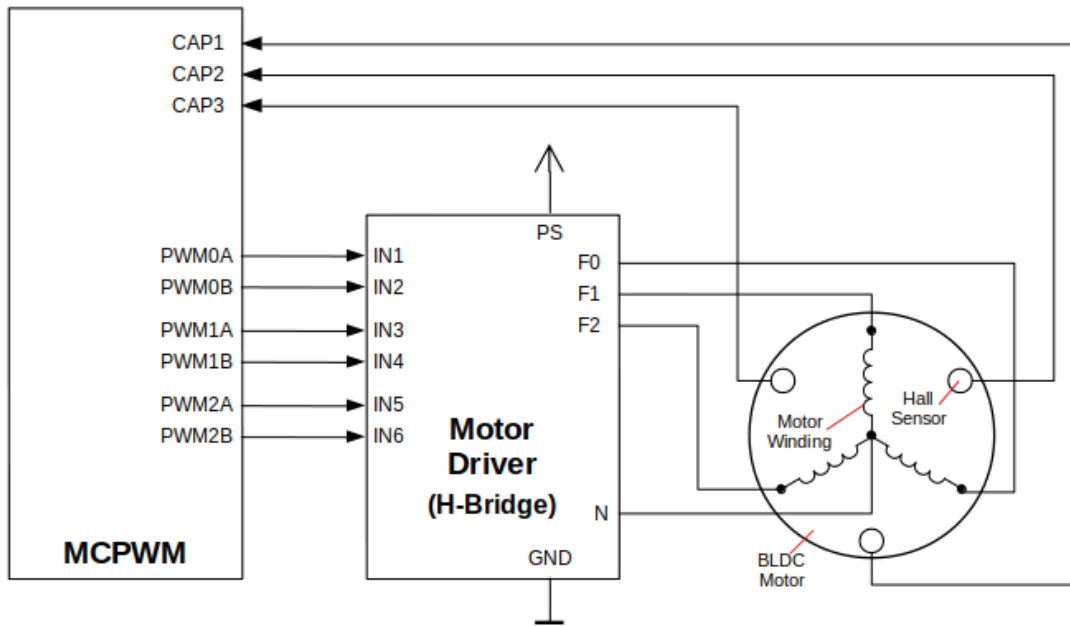

Fig. 18: Example of Brushless DC Motor Control with MCPWM

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section [Configure](#).
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable()`, selecting desired signal input from `mcpwm_capture_signal_t`, setting the signal edge with `mcpwm_capture_on_edge_t` and the signal count prescaler.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer's value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable()`.

### Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:

- State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
- The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

## Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then alerted at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details please refer to “PWM Carrier Submodule” section of the [ESP32 Technical Reference Manual](#).

To disable carrier functionality call `mcpwm_carrier_disable()`.

## Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`.

## Application Example

Examples of using MCPWM for motor control: [peripherals/mcpwm](#):

- Demonstration how to use each submodule of the MCPWM - [peripherals/mcpwm/mcpwm\\_basic\\_config](#)
- Control of BLDC (brushless DC) motor with hall sensor feedback - [peripherals/mcpwm/mcpwm\\_bldc\\_control](#)
- Brushed DC motor control - [peripherals/mcpwm/mcpwm\\_brushed\\_dc\\_control](#)
- Servo motor control - [peripherals/mcpwm/mcpwm\\_servo\\_control](#)

## API Reference

### Header File

- [soc/include/hal/mcpwm\\_types.h](#)

### Enumerations

`enum mcpwm_intr_t`

Interrupts for MCPWM.

Values:

**MCPWM\_LL\_INTR\_CAP0** = BIT(27)  
Capture 0 happened.

**MCPWM\_LL\_INTR\_CAP1** = BIT(28)  
Capture 1 happened.

**MCPWM\_LL\_INTR\_CAP2** = BIT(29)  
Capture 2 happened.

**enum mcpwm\_counter\_type\_t**  
Select type of MCPWM counter.

*Values:*

**MCPWM\_UP\_COUNTER** = 1  
For asymmetric MCPWM

**MCPWM\_DOWN\_COUNTER**  
For asymmetric MCPWM

**MCPWM\_UP\_DOWN\_COUNTER**  
For symmetric MCPWM, frequency is half of MCPWM frequency set

**MCPWM\_COUNTER\_MAX**  
Maximum counter mode

**enum mcpwm\_duty\_type\_t**  
Select type of MCPWM duty cycle mode.

*Values:*

**MCPWM\_DUTY\_MODE\_0** = 0  
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

**MCPWM\_DUTY\_MODE\_1**  
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted)  
MCPWM

**MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_LOW**

**MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_HIGH**

**MCPWM\_DUTY\_MODE\_MAX**  
Num of duty cycle modes

**enum mcpwm\_output\_action\_t**  
MCPWM select action to be taken on the output when event happens.

*Values:*

**MCPWM\_ACTION\_NO\_CHANGE** = 0  
No change in the output

**MCPWM\_ACTION\_FORCE\_LOW**  
Make output low

**MCPWM\_ACTION\_FORCE\_HIGH**  
Make output high

**MCPWM\_ACTION\_TOGGLE**  
Make output toggle

**enum mcpwm\_deadtime\_type\_t**  
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:*

**MCPWM\_DEADTIME\_BYPASS** = 0  
Bypass the deadtime

**MCPWM\_BYPASS\_RED**

MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

**MCPWM\_BYPASS\_FED**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

**MCPWM\_ACTIVE\_HIGH\_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

**MCPWM\_ACTIVE\_LOW\_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

**MCPWM\_ACTIVE\_HIGH\_COMPLIMENT\_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

**MCPWM\_ACTIVE\_LOW\_COMPLIMENT\_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

**MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXA**

MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

**MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXB**

MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

**MCPWM\_DEADTIME\_TYPE\_MAX****enum mcpwm\_sync\_signal\_t**

MCPWM select sync signal input.

*Values:*

**MCPWM\_SELECT\_SYNC0 = 4**

Select SYNC0 as input

**MCPWM\_SELECT\_SYNC1**

Select SYNC1 as input

**MCPWM\_SELECT\_SYNC2**

Select SYNC2 as input

**enum mcpwm\_capture\_on\_edge\_t**

MCPWM select capture starts from which edge.

*Values:*

**MCPWM\_NEG\_EDGE = BIT(0)**

Capture the negative edge

**MCPWM\_POS\_EDGE = BIT(1)**

Capture the positive edge

**Functions**

*esp\_err\_t* **mcpwm\_gpio\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_io\_signals\_t* io\_signal, int gpio\_num)

This function initializes each gpio signal for MCPWM.

**Note** This function initializes one gpio at a time.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- io\_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC\_X, FAULT\_X, CAP\_X) ‘X’ is timer\_num(0-2)
- gpio\_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio\_num = 16

*esp\_err\_t* **mcpwm\_set\_pin** (*mcpwm\_unit\_t* mcpwm\_num, const *mcpwm\_pin\_config\_t* \*mcpwm\_pin)

Initialize MCPWM gpio structure.

**Note** This function can be used to initialize more then one gpio at a time.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- mcpwm\_pin: MCPWM pin structure

*esp\_err\_t* **mcpwm\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, const *mcpwm\_config\_t* \*mcpwm\_conf)

Initialize MCPWM parameters.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm\_conf: configure structure *mcpwm\_config\_t*

*esp\_err\_t* **mcpwm\_set\_frequency** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, uint32\_t frequency)

Set frequency(in Hz) of MCPWM timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

*esp\_err\_t* **mcpwm\_set\_duty** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty: set duty cycle in %(i.e for 62.3% duty cycle, duty = 62.3) of each operator

*esp\_err\_t* **mcpwm\_set\_duty\_in\_us** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, *uint32\_t* duty\_in\_us)

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), 'x' is operator number selected
- duty\_in\_us: set duty value in microseconds of each operator

*esp\_err\_t* **mcpwm\_set\_duty\_type** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, *mcpwm\_duty\_type\_t* duty\_type)

Set duty either active high or active low(out of phase/inverted)

**Note** Call this function every time after mcpwm\_set\_signal\_high or mcpwm\_set\_signal\_low to resume with previously set duty cycle

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), 'x' is operator number selected
- duty\_type: set active low or active high duty type

*uint32\_t* **mcpwm\_get\_frequency** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Get frequency of timer.

**Return**

- frequency of timer

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*float* **mcpwm\_get\_duty** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_operator\_t* gen)

Get duty cycle of each operator.

**Return**

- duty cycle in % of each operator(56.7 means duty is 56.7%)

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), 'x' is operator number selected

*esp\_err\_t* **mcpwm\_set\_signal\_high** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen)

Use this function to set MCPWM signal high.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMXB), 'x' is timer number selected

*esp\_err\_t* **mcpwm\_set\_signal\_low** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen)

Use this function to set MCPWM signal low.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), 'x' is timer number selected

*esp\_err\_t* **mcpwm\_start** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Start MCPWM signal on timer 'x' .

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_stop** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Start MCPWM signal on timer 'x' .

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_init** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, **const** *mcpwm\_carrier\_config\_t* \*`carrier_conf`)

Initialize carrier configuration.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure *mcpwm\_carrier\_config\_t*

*esp\_err\_t* **mcpwm\_carrier\_enable** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Enable MCPWM carrier submodule, for respective timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_disable** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Disable MCPWM carrier submodule, for respective timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_set\_period** (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *uint8\_t* `carrier_period`)

Set period of carrier.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_period`: set the carrier period of each timer, carrier period = (carrier\_period + 1)\*800ns (carrier\_period <= 15)

`esp_err_t mcpwm_carrier_set_duty_cycle` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, `uint8_t carrier_duty`)

Set duty\_cycle of carrier.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_duty`: set duty\_cycle of carrier , carrier duty cycle = carrier\_duty\*12.5% (chop\_duty <= 7)

`esp_err_t mcpwm_carrier_oneshot_mode_enable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, `uint8_t pulse_width`)

Enable and set width of first pulse in carrier oneshot mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `pulse_width`: set pulse width of first pulse in oneshot mode, width = (carrier period)\*(pulse\_width + 1) (pulse\_width <= 15)

`esp_err_t mcpwm_carrier_oneshot_mode_disable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Disable oneshot mode, width of first pulse = carrier period.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_output_invert` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *mcpwm\_carrier\_out\_ivt\_t* `carrier_ivt_mode`)

Enable or disable carrier output inversion.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_ivt_mode`: enable or disable carrier output inversion

`esp_err_t mcpwm_deadtime_enable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *mcpwm\_deadtime\_type\_t* `dt_mode`, `uint32_t red`, `uint32_t fed`)

Enable and initialize deadtime for each MCPWM timer.

**Return**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = `red*100ns`
- `fed`: set rising edge delay = `fed*100ns`

`esp_err_t mcpwm_deadtime_disable` (`mcpwm_unit_t mcpwm_num`, `mcpwm_timer_t timer_num`)

Disable deadtime on MCPWM timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_fault_init` (`mcpwm_unit_t mcpwm_num`, `mcpwm_fault_input_level_t input_level`,  
`mcpwm_fault_signal_t fault_sig`)

Initialize fault submodule, currently low level triggering is not supported.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_sig`: set the fault pin, which needs to be enabled

`esp_err_t mcpwm_fault_set_oneshot_mode` (`mcpwm_unit_t mcpwm_num`, `mcpwm_timer_t timer_num`,  
`mcpwm_fault_signal_t fault_sig`,  
`mcpwm_output_action_t action_on_pwmxa`,  
`mcpwm_output_action_t action_on_pwmxb`)

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_set_cyc_mode` (`mcpwm_unit_t mcpwm_num`, `mcpwm_timer_t timer_num`,  
`mcpwm_fault_signal_t fault_sig`, `mcpwm_output_action_t action_on_pwmxa`,  
`mcpwm_output_action_t action_on_pwmxb`)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note** currently low level triggering is not supported

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)

- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for cyc mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_deinit` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_fault\_signal\_t* `fault_sig`)

Disable fault signal.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `fault_sig`: fault pin, which needs to be disabled

`esp_err_t mcpwm_capture_enable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_capture\_signal\_t* `cap_sig`, *mcpwm\_capture\_on\_edge\_t* `cap_edge`, *uint32\_t* `num_of_pulse`)

Initialize capture submodule.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: count time between rising/falling edge between 2 \*(pulses mentioned), counter uses APB\_CLK

`esp_err_t mcpwm_capture_disable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_capture\_signal\_t* `cap_sig`)

Disable capture signal.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

*uint32\_t* `mcpwm_capture_signal_get_value` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_capture\_signal\_t* `cap_sig`)

Get capture value.

**Return** Captured value

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin on which value is to be measured

*uint32\_t* `mcpwm_capture_signal_get_edge` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_capture\_signal\_t* `cap_sig`)

Get edge of capture signal.

**Return** Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin of whose edge is to be determined

`esp_err_t mcpwm_sync_enable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *mcpwm\_sync\_signal\_t* `sync_sig`, *uint32\_t* `phase_val`)

Initialize sync submodule.

**Return**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization pin, which needs to be enabled
- `phase_val`: phase value in 1/1000 (for 86.7%, `phase_val = 867`) which timer moves to on sync signal

`esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Disable sync submodule on given timer.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void (*fn)) void *`

, void \*arg, int intr\_alloc\_flags, intr\_handle\_t \*handle Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. see `esp_intr_alloc.h` for more info.
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

## Structures

`struct mcpwm_pin_config_t`

MCPWM pin number for.

### Public Members

int `mcpwm0a_out_num`  
MCPWM0A out pin

int `mcpwm0b_out_num`  
MCPWM0A out pin

int `mcpwm1a_out_num`  
MCPWM0A out pin

int `mcpwm1b_out_num`  
MCPWM0A out pin

int `mcpwm2a_out_num`  
MCPWM0A out pin

int `mcpwm2b_out_num`  
MCPWM0A out pin

int `mcpwm_sync0_in_num`  
SYNC0 in pin

int `mcpwm_sync1_in_num`  
SYNC1 in pin

`int mcpwm_sync2_in_num`  
SYNC2 in pin

`int mcpwm_fault0_in_num`  
FAULT0 in pin

`int mcpwm_fault1_in_num`  
FAULT1 in pin

`int mcpwm_fault2_in_num`  
FAULT2 in pin

`int mcpwm_cap0_in_num`  
CAP0 in pin

`int mcpwm_cap1_in_num`  
CAP1 in pin

`int mcpwm_cap2_in_num`  
CAP2 in pin

`struct mcpwm_config_t`  
MCPWM config structure.

### Public Members

`uint32_t frequency`  
Set frequency of MCPWM in Hz

`float cmpr_a`  
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, `duty_a = 62.3`

`float cmpr_b`  
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, `duty_b = 48.0`

`mcpwm_duty_type_t duty_mode`  
Set type of duty cycle

`mcpwm_counter_type_t counter_mode`  
Set type of MCPWM counter

`struct mcpwm_carrier_config_t`  
MCPWM config carrier structure.

### Public Members

`uint8_t carrier_period`  
Set carrier period =  $(\text{carrier\_period} + 1) * 800\text{ns}$ , `carrier\_period` should be  $< 16$

`uint8_t carrier_duty`  
Set carrier duty cycle, `carrier\_duty` should be less than 8 (increment every 12.5%)

`uint8_t pulse_width_in_os`  
Set pulse width of first pulse in one shot mode =  $(\text{carrier\_period}) * (\text{pulse\_width\_in\_os} + 1)$ , should be less than 16

`mcpwm_carrier_os_t carrier_os_mode`  
Enable or disable carrier oneshot mode

`mcpwm_carrier_out_ivt_t carrier_ivt_mode`  
Invert output of carrier

### Macros

**MCPWM\_OPR\_A**

**MCPWM\_OPR\_B**

**MCPWM\_OPR\_MAX**

**MCPWM\_NO\_CHANGE\_IN\_MCPWMXA**

**MCPWM\_FORCE\_MCPWMXA\_LOW**

**MCPWM\_FORCE\_MCPWMXA\_HIGH**

**MCPWM\_TOG\_MCPWMXA**

**MCPWM\_NO\_CHANGE\_IN\_MCPWMXB**

**MCPWM\_FORCE\_MCPWMXB\_LOW**

**MCPWM\_FORCE\_MCPWMXB\_HIGH**

**MCPWM\_TOG\_MCPWMXB**

### Type Definitions

**typedef** *mcpwm\_generator\_t* mcpwm\_operator\_t

**typedef** *mcpwm\_output\_action\_t* mcpwm\_action\_on\_pwmxa\_t

**typedef** *mcpwm\_output\_action\_t* mcpwm\_action\_on\_pwmxb\_t

### Enumerations

**enum** mcpwm\_io\_signals\_t

IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

*Values:*

**MCPWM0A** = 0

PWM0A output pin

**MCPWM0B**

PWM0B output pin

**MCPWM1A**

PWM1A output pin

**MCPWM1B**

PWM1B output pin

**MCPWM2A**

PWM2A output pin

**MCPWM2B**

PWM2B output pin

**MCPWM\_SYNC\_0**

SYNC0 input pin

**MCPWM\_SYNC\_1**

SYNC1 input pin

**MCPWM\_SYNC\_2**

SYNC2 input pin

**MCPWM\_FAULT\_0**

FAULT0 input pin

**MCPWM\_FAULT\_1**  
FAULT1 input pin

**MCPWM\_FAULT\_2**  
FAULT2 input pin

**MCPWM\_CAP\_0** = 84  
CAP0 input pin

**MCPWM\_CAP\_1**  
CAP1 input pin

**MCPWM\_CAP\_2**  
CAP2 input pin

**enum mcpwm\_unit\_t**  
Select MCPWM unit.

*Values:*

**MCPWM\_UNIT\_0** = 0  
MCPWM unit0 selected

**MCPWM\_UNIT\_1**  
MCPWM unit1 selected

**MCPWM\_UNIT\_MAX**  
Num of MCPWM units on ESP32

**enum mcpwm\_timer\_t**  
Select MCPWM timer.

*Values:*

**MCPWM\_TIMER\_0** = 0  
Select MCPWM timer0

**MCPWM\_TIMER\_1**  
Select MCPWM timer1

**MCPWM\_TIMER\_2**  
Select MCPWM timer2

**MCPWM\_TIMER\_MAX**  
Num of MCPWM timers on ESP32

**enum mcpwm\_generator\_t**  
Select MCPWM operator.

*Values:*

**MCPWM\_GEN\_A** = 0  
Select MCPWMXA, where 'X' is operator number

**MCPWM\_GEN\_B**  
Select MCPWMXB, where 'X' is operator number

**MCPWM\_GEN\_MAX**  
Num of generators to each operator of MCPWM

**enum mcpwm\_carrier\_os\_t**  
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

*Values:*

**MCPWM\_ONESHOT\_MODE\_DIS** = 0  
Enable oneshot mode

**MCPWM\_ONESHOT\_MODE\_EN**  
Disable oneshot mode

**enum mcpwm\_carrier\_out\_ivt\_t**

MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

*Values:*

**MCPWM\_CARRIER\_OUT\_IVT\_DIS = 0**

Enable carrier output inversion

**MCPWM\_CARRIER\_OUT\_IVT\_EN**

Disable carrier output inversion

**enum mcpwm\_fault\_signal\_t**

MCPWM select fault signal input.

*Values:*

**MCPWM\_SELECT\_F0 = 0**

Select F0 as input

**MCPWM\_SELECT\_F1**

Select F1 as input

**MCPWM\_SELECT\_F2**

Select F2 as input

**enum mcpwm\_fault\_input\_level\_t**

MCPWM select triggering level of fault signal.

*Values:*

**MCPWM\_LOW\_LEVEL\_TGR = 0**

Fault condition occurs when fault input signal goes from high to low, currently not supported

**MCPWM\_HIGH\_LEVEL\_TGR**

Fault condition occurs when fault input signal goes low to high

**enum mcpwm\_capture\_signal\_t**

MCPWM select capture signal input.

*Values:*

**MCPWM\_SELECT\_CAP0 = 0**

Select CAP0 as input

**MCPWM\_SELECT\_CAP1**

Select CAP1 as input

**MCPWM\_SELECT\_CAP2**

Select CAP2 as input

## 2.3.9 Pulse Counter

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

### Functionality Overview

Description of functionality of this API has been broken down into four sections:

- [Configuration](#) - describes counter's configuration parameters and how to setup the counter.

- *Operating the Counter* - provides information on control functions to pause, measure and clear the counter.
- *Filtering Pulses* - describes options to filtering pulses and the counter control signals.
- *Using Interrupts* - presents how to trigger interrupts on specific states of the counter.

## Configuration

The PCNT module has eight independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

## Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

---

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB\_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB\_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a *filer*.

---

## Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB\_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB\_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

## Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

## Application Example

Pulse counter with control signal and event interrupt example: [peripherals/pcnt](#).

## API Reference

### Header File

- [driver/include/driver/pcnt.h](#)

### Functions

`esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)`

Configure Pulse Counter unit.

**Note** This function will disable three events: `PCNT_EVT_L_LIM`, `PCNT_EVT_H_LIM`, `PCNT_EVT_ZERO`.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver already initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `pcnt_config`: Pointer of Pulse Counter unit configure parameter

`esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)`

Get pulse counter value.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `pcnt_unit`: Pulse Counter unit number
- `count`: Pointer to accept counter value

`esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)`

Pause PCNT counter of PCNT unit.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `pcnt_unit`: PCNT unit number

*esp\_err\_t* **pcnt\_counter\_resume** (*pcnt\_unit\_t* *pcnt\_unit*)

Resume counting for PCNT counter.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *pcnt\_unit*: PCNT unit number, select from *pcnt\_unit\_t*

*esp\_err\_t* **pcnt\_counter\_clear** (*pcnt\_unit\_t* *pcnt\_unit*)

Clear and reset PCNT counter value to zero.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *pcnt\_unit*: PCNT unit number, select from *pcnt\_unit\_t*

*esp\_err\_t* **pcnt\_intr\_enable** (*pcnt\_unit\_t* *pcnt\_unit*)

Enable PCNT interrupt for PCNT unit.

**Note** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with *pcnt\_event\_enable()* and *pcnt\_event\_disable()*

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *pcnt\_unit*: PCNT unit number

*esp\_err\_t* **pcnt\_intr\_disable** (*pcnt\_unit\_t* *pcnt\_unit*)

Disable PCNT interrupt for PCNT unit.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *pcnt\_unit*: PCNT unit number

*esp\_err\_t* **pcnt\_event\_enable** (*pcnt\_unit\_t* *unit*, *pcnt\_evt\_type\_t* *evt\_type*)

Enable PCNT event of PCNT unit.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number
- *evt\_type*: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

*esp\_err\_t* **pcnt\_event\_disable** (*pcnt\_unit\_t* *unit*, *pcnt\_evt\_type\_t* *evt\_type*)

Disable PCNT event of PCNT unit.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number

- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_set_event_value` (`pcnt_unit_t unit`, `pcnt_evt_type_t evt_type`, `int16_t value`)

Set PCNT event value of PCNT unit.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Counter value for PCNT event

`esp_err_t pcnt_get_event_value` (`pcnt_unit_t unit`, `pcnt_evt_type_t evt_type`, `int16_t *value`)

Get PCNT event value of PCNT unit.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Pointer to accept counter value for PCNT event

`esp_err_t pcnt_isr_register` (`void (*fn)`) `void *`

, `void *arg`, `int intr_alloc_flags`, `pcnt_isr_handle_t *handle` Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

#### Return

- `ESP_OK` Success
- `ESP_ERR_NOT_FOUND` Can not find the interrupt that matches the flags.
- `ESP_ERR_INVALID_ARG` Function pointer error.

#### Parameters

- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`OR`ed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `esp_intr_free` to unregister this ISR service if needed, but only if the handle is not NULL.

`esp_err_t pcnt_set_pin` (`pcnt_unit_t unit`, `pcnt_channel_t channel`, `int pulse_io`, `int ctrl_io`)

Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to `PCNT_PIN_NOT_USED` if unused.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `unit`: PCNT unit number
- `channel`: PCNT channel number
- `pulse_io`: Pulse signal input GPIO
- `ctrl_io`: Control signal input GPIO

`esp_err_t pcnt_filter_enable` (`pcnt_unit_t unit`)

Enable PCNT input filter.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `unit`: PCNT unit number

*esp\_err\_t* **pcnt\_filter\_disable** (*pcnt\_unit\_t* `unit`)

Disable PCNT input filter.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `unit`: PCNT unit number

*esp\_err\_t* **pcnt\_set\_filter\_value** (*pcnt\_unit\_t* `unit`, *uint16\_t* `filter_val`)

Set PCNT filter value.

**Note** `filter_val` is a 10-bit value, so the maximum `filter_val` should be limited to 1023.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `unit`: PCNT unit number
- `filter_val`: PCNT signal filter value, counter in APB\_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

*esp\_err\_t* **pcnt\_get\_filter\_value** (*pcnt\_unit\_t* `unit`, *uint16\_t* \*`filter_val`)

Get PCNT filter value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `unit`: PCNT unit number
- `filter_val`: Pointer to accept PCNT filter value.

*esp\_err\_t* **pcnt\_set\_mode** (*pcnt\_unit\_t* `unit`, *pcnt\_channel\_t* `channel`, *pcnt\_count\_mode\_t* `pos_mode`, *pcnt\_count\_mode\_t* `neg_mode`, *pcnt\_ctrl\_mode\_t* `hctrl_mode`, *pcnt\_ctrl\_mode\_t* `lctrl_mode`)

Set PCNT counter mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `unit`: PCNT unit number
- `channel`: PCNT channel number
- `pos_mode`: Counter mode when detecting positive edge
- `neg_mode`: Counter mode when detecting negative edge
- `hctrl_mode`: Counter mode when control signal is high level
- `lctrl_mode`: Counter mode when control signal is low level

*esp\_err\_t* **pcnt\_isr\_handler\_add** (*pcnt\_unit\_t* `unit`, *void* (\*`isr_handler`)) *void* \*`args`

Add ISR handler for specified unit.

Call this function after using `pcnt_isr_service_install()` to install the PCNT driver's ISR handler service.

The ISR handlers do not need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `pcnt_isr_service_install()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in `menuconfig`). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `isr_handler`: Interrupt handler function.
- `args`: Parameter for handler function

*esp\_err\_t* `pcnt_isr_service_install` (int *intr\_alloc\_flags*)

Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void `pcnt_isr_service_uninstall` (void)

Uninstall PCNT ISR service, freeing related resources.

*esp\_err\_t* `pcnt_isr_handler_remove` (*pcnt\_unit\_t* *unit*)

Delete ISR handler for specified unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number

**Type Definitions**

```
typedef intr_handle_t pcnt_isr_handle_t
```

**Header File**

- `soc/include/hal/pcnt_types.h`

**Structures**

```
struct pcnt_config_t
```

Pulse Counter configuration for a single channel.

**Public Members**

```
int pulse_gpio_num
```

Pulse input GPIO number, if you want to use GPIO16, enter `pulse_gpio_num = 16`, a negative value will

be ignored

int **ctrl\_gpio\_num**

Control signal input GPIO number, a negative value will be ignored

*pcnt\_ctrl\_mode\_t* **lctrl\_mode**

PCNT low control mode

*pcnt\_ctrl\_mode\_t* **hctrl\_mode**

PCNT high control mode

*pcnt\_count\_mode\_t* **pos\_mode**

PCNT positive edge count mode

*pcnt\_count\_mode\_t* **neg\_mode**

PCNT negative edge count mode

int16\_t **counter\_h\_lim**

Maximum counter value

int16\_t **counter\_l\_lim**

Minimum counter value

*pcnt\_unit\_t* **unit**

PCNT unit number

*pcnt\_channel\_t* **channel**

the PCNT channel

### Type Definitions

**typedef** int **pcnt\_port\_t**

PCNT port number, the max port number is (PCNT\_PORT\_MAX - 1).

**typedef** int **pcnt\_unit\_t**

Selection of all available PCNT units.

### Enumerations

**enum** **pcnt\_ctrl\_mode\_t**

Selection of available modes that determine the counter's action depending on the state of the control signal's input GPIO.

**Note** Configuration covers two actions, one for high, and one for low level on the control input

*Values:*

**PCNT\_MODE\_KEEP** = 0

Control mode: won't change counter mode

**PCNT\_MODE\_REVERSE** = 1

Control mode: invert counter mode(increase -> decrease, decrease -> increase)

**PCNT\_MODE\_DISABLE** = 2

Control mode: Inhibit counter(counter value will not change in this condition)

**PCNT\_MODE\_MAX**

**enum** **pcnt\_count\_mode\_t**

Selection of available modes that determine the counter's action on the edge of the pulse signal's input GPIO.

**Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input

*Values:*

**PCNT\_COUNT\_DIS** = 0

Counter mode: Inhibit counter(counter value will not change in this condition)

**PCNT\_COUNT\_INC** = 1

Counter mode: Increase counter value

**PCNT\_COUNT\_DEC = 2**  
Counter mode: Decrease counter value

**PCNT\_COUNT\_MAX**

**enum pcnt\_channel\_t**  
Selection of channels available for a single PCNT unit.

*Values:*

**PCNT\_CHANNEL\_0 = 0x00**  
PCNT channel 0

**PCNT\_CHANNEL\_1 = 0x01**  
PCNT channel 1

**PCNT\_CHANNEL\_MAX**

**enum pcnt\_evt\_type\_t**  
Selection of counter's events that may trigger an interrupt.

*Values:*

**PCNT\_EVT\_THRES\_1 = BIT(2)**  
PCNT watch point event: threshold1 value event

**PCNT\_EVT\_THRES\_0 = BIT(3)**  
PCNT watch point event: threshold0 value event

**PCNT\_EVT\_L\_LIM = BIT(4)**  
PCNT watch point event: Minimum counter value

**PCNT\_EVT\_H\_LIM = BIT(5)**  
PCNT watch point event: Maximum counter value

**PCNT\_EVT\_ZERO = BIT(6)**  
PCNT watch point event: counter value zero event

**PCNT\_EVT\_MAX**

### 2.3.10 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to the flexibility of the RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by the RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

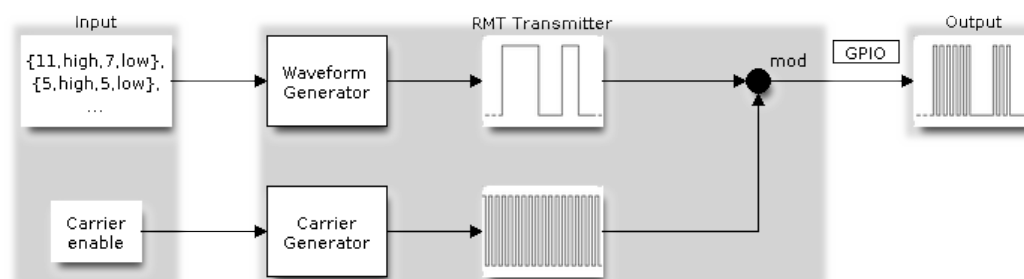

Fig. 19: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

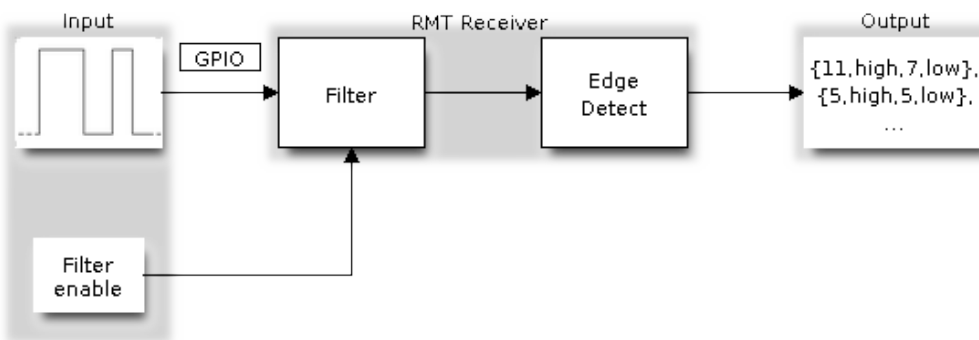

Fig. 20: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. *Configure Driver*
2. *Transmit Data or Receive Data*
3. *Change Operation Parameters*
4. *Use Interrupts*

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

### Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

### Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt\_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio\_num**.
- How many **memory blocks** will be used by the channel, set with **mem\_block\_num**.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk\_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default.

---

**Note:** The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

---

There are also couple of specific parameters that should be set up depending if selected channel is configured in *Transmit Mode* or *Receive Mode*:

**Transmit Mode** When configuring channel in transmit mode, set **tx\_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop\_en**
- Enable the RMT carrier signal - **carrier\_en**
- Frequency of the carrier in Hz - **carrier\_freq\_hz**

- Duty cycle of the carrier signal in percent (%) - **carrier\_duty\_percent**
- Level of the RMT output, when the carrier is applied - **carrier\_level**
- Enable the RMT output if idle - **idle\_output\_en**
- Set the signal level on the RMT output if idle - **idle\_level**

**Receive Mode** In receive mode, set **rx\_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter\_en**
- A threshold of the filter, set in the number of ticks - **filter\_ticks\_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle\_threshold**. The receiver will ignore pulses longer than this setting.

**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is  $> 0$ , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either *Transmit Data* or *Receive Data*. This is described in next two sections.

### Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`, see [soc/esp32/include/soc/rmt\\_caps.h](#). Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

Fig. 21: Structure of RMT items (L - signal level)

For a simple example how to define a block of items see [peripherals/rmt/morse\\_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This

function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT's internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller's internal memory, see `rmt_set_mem_block_num()`.

## Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels. In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in [peripherals/rmt/ir\\_protocols](#).

To stop the receiver, call `rmt_rx_stop()`.

## Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

## Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

## Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

## Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

## Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

---

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

---

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, 7] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

## Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

## Application Examples

- A simple RMT TX example: [peripherals/rmt/morse\\_code](#).
- Another RMT TX example, specific to drive a common RGB LED strip: [peripherals/rmt/led\\_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir\\_protocols](#).

## API Reference

### Header File

- `driver/include/driver/rmt.h`

### Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `div_cnt`: RMT counter clock divider

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)`

Get RMT clock divider, channel clock is divided from source clock.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error

- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `div_cnt`: pointer to accept RMT counter divider

*esp\_err\_t* **rmt\_set\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, uint16\_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thres` channel clock cycles, the receive process is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `thresh`: RMT RX idle threshold

*esp\_err\_t* **rmt\_get\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, uint16\_t \*thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thres` channel clock cycles, the receive process is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `thresh`: pointer to accept RMT RX idle threshold value

*esp\_err\_t* **rmt\_set\_mem\_block\_num** (*rmt\_channel\_t* channel, uint8\_t rmt\_mem\_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel `n`. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel `n` is `start_addr_CHn` to `end_addr_CHn`, which are defined by: Memory block start address is `RMT_CHANNEL_MEM(n)` (in `soc/rmt_reg.h`), that is, `start_addr_chn = RMT base address + 0x800 + 64 * 4 * n`, and `end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4`

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `rmt_mem_num`: RMT RX memory block number, one block has  $64 * 32$  bits.

*esp\_err\_t* **rmt\_get\_mem\_block\_num** (*rmt\_channel\_t* channel, uint8\_t \*rmt\_mem\_num)

Get RMT memory block number.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `rmt_mem_num`: Pointer to accept RMT RX memory block number

*esp\_err\_t* **rmt\_set\_tx\_carrier** (*rmt\_channel\_t* channel, bool carrier\_en, uint16\_t high\_level, uint16\_t low\_level, *rmt\_carrier\_level\_t* carrier\_level)

Configure RMT carrier for TX signal.

Set different values for carrier\_high and carrier\_low to set different frequency of carrier. The unit of carrier\_high/low is the source clock tick, not the divided channel counter clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- carrier\_en: Whether to enable output carrier.
- high\_level: High level duration of carrier
- low\_level: Low level duration of carrier.
- carrier\_level: Configure the way carrier wave is modulated for channel.
  - 1' b1:transmit on low output level
  - 1' b0:transmit on high output level

*esp\_err\_t* **rmt\_set\_mem\_pd** (*rmt\_channel\_t* channel, bool pd\_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- pd\_en: RMT memory low power enable.

*esp\_err\_t* **rmt\_get\_mem\_pd** (*rmt\_channel\_t* channel, bool \*pd\_en)

Get RMT memory low power mode.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- pd\_en: Pointer to accept RMT memory low power mode.

*esp\_err\_t* **rmt\_tx\_start** (*rmt\_channel\_t* channel, bool tx\_idx\_rst)

Set RMT start sending data from memory.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- tx\_idx\_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

*esp\_err\_t* **rmt\_tx\_stop** (*rmt\_channel\_t* channel)

Set RMT stop sending.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_rx\_start** (*rmt\_channel\_t* channel, bool rx\_idx\_rst)

Set RMT start receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `rx_idx_rst`: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

*esp\_err\_t* **rmt\_rx\_stop**(*rmt\_channel\_t* channel)

Set RMT stop receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

*esp\_err\_t* **rmt\_memory\_rw\_rst**(*rmt\_channel\_t* channel)

Reset RMT TX/RX memory index.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

*esp\_err\_t* **rmt\_set\_memory\_owner**(*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* owner)

Set RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `owner`: To set when the transmitter or receiver can process the memory of channel.

*esp\_err\_t* **rmt\_get\_memory\_owner**(*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* \*owner)

Get RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `owner`: Pointer to get memory owner.

*esp\_err\_t* **rmt\_set\_tx\_loop\_mode**(*rmt\_channel\_t* channel, bool loop\_en)

Set RMT tx loop mode.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

*esp\_err\_t* **rmt\_get\_tx\_loop\_mode**(*rmt\_channel\_t* channel, bool \*loop\_en)

Get RMT tx loop mode.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

*esp\_err\_t* **rmt\_set\_rx\_filter** (*rmt\_channel\_t* channel, bool rx\_filter\_en, uint8\_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

*esp\_err\_t* **rmt\_set\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* base\_clk)

Set RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

*esp\_err\_t* **rmt\_get\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* \*src\_clk)

Get RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

*esp\_err\_t* **rmt\_set\_idle\_level** (*rmt\_channel\_t* channel, bool idle\_out\_en, *rmt\_idle\_level\_t* level)

Set RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal's level for channel in idle state.

*esp\_err\_t* **rmt\_get\_idle\_level** (*rmt\_channel\_t* channel, bool \*idle\_out\_en, *rmt\_idle\_level\_t* \*level)

Get RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: Pointer to accept value of enable idle.

- `level`: Pointer to accept value of output signal's level in idle state for specified channel.

*esp\_err\_t* **rmt\_get\_status** (*rmt\_channel\_t* channel, uint32\_t \*status)

Get RMT status.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `status`: Pointer to accept channel status. Please refer to `RMT_CHnSTATUS_REG(n=0~7)` in `rmt_reg.h` for more details of each field.

void **rmt\_set\_intr\_enable\_mask** (uint32\_t mask)

Set mask value to RMT interrupt enable register.

**Parameters**

- `mask`: Bit mask to set to the register

void **rmt\_clr\_intr\_enable\_mask** (uint32\_t mask)

Clear mask value to RMT interrupt enable register.

**Parameters**

- `mask`: Bit mask to clear the register

*esp\_err\_t* **rmt\_set\_rx\_intr\_en** (*rmt\_channel\_t* channel, bool en)

Set RMT RX interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable RX interrupt.

*esp\_err\_t* **rmt\_set\_err\_intr\_en** (*rmt\_channel\_t* channel, bool en)

Set RMT RX error interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable RX err interrupt.

*esp\_err\_t* **rmt\_set\_tx\_intr\_en** (*rmt\_channel\_t* channel, bool en)

Set RMT TX interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable TX interrupt.

*esp\_err\_t* **rmt\_set\_tx\_thr\_intr\_en** (*rmt\_channel\_t* channel, bool en, uint16\_t evt\_thresh)

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable TX event interrupt.

- `evt_thresh`: RMT event interrupt threshold value

`esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`

Set RMT pin.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `mode`: TX or RX mode for RMT
- `gpio_num`: GPIO number to transmit or receive the signal.

`esp_err_t rmt_config(const rmt_config_t *rmt_param)`

Configure RMT parameters.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `rmt_param`: RMT parameter struct

`esp_err_t rmt_isr_register(void (*fn)) void *`

`, void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle` Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.
- `ESP_FAIL` System driver installed, can not register ISR handler for RMT

#### Parameters

- `fn`: Interrupt handler function.
- `arg`: Parameter for the handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: If non-zero, a handle to later clean up the ISR gets stored here.

`esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)`

Deregister previously registered RMT interrupt handler.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Handle invalid

#### Parameters

- `handle`: Handle obtained from `rmt_isr_register`

`esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)`

Fill memory data of channel with given RMT items.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `item`: Pointer of items.
- `item_num`: RMT sending items number.
- `mem_offset`: Index offset of memory.

*esp\_err\_t* **rmt\_driver\_install** (*rmt\_channel\_t* channel, *size\_t* rx\_buf\_size, *int* intr\_alloc\_flags)

Initialize RMT driver.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver is already installed, call rmt\_driver\_uninstall first.
- ESP\_ERR\_NO\_MEM Memory allocation failure
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rx\_buf\_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr\_alloc\_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp\_intr\_alloc.h for details. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.

*esp\_err\_t* **rmt\_driver\_uninstall** (*rmt\_channel\_t* channel)

Uninstall RMT driver.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_get\_channel\_status** (*rmt\_channel\_status\_result\_t* \*channel\_status)

Get the current status of eight channels.

**Note** Do not call this function if it is possible that rmt\_driver\_uninstall will be called at the same time.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- [out] channel\_status: store the current status of each channel

*esp\_err\_t* **rmt\_get\_counter\_clock** (*rmt\_channel\_t* channel, *uint32\_t* \*clock\_hz)

Get speed of channel's internal counter clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- [out] clock\_hz: counter clock speed, in hz

*esp\_err\_t* **rmt\_write\_items** (*rmt\_channel\_t* channel, **const** *rmt\_item32\_t* \*rmt\_item, *int* item\_num, *bool* wait\_tx\_done)

RMT send waveform from rmt\_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait\_tx\_done is set to true, this function will block and will not return until all items have been sent out. If wait\_tx\_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_item: head point of RMT items array. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.

- `item_num`: RMT data item number.
- `wait_tx_done`:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

*esp\_err\_t* **rmt\_wait\_tx\_done** (*rmt\_channel\_t* channel, TickType\_t wait\_time)  
Wait RMT TX finished.

**Return**

- ESP\_OK RMT Tx done successfully
- ESP\_ERR\_TIMEOUT Exceeded the 'wait\_time' given
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- `channel`: RMT channel
- `wait_time`: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP\_ERR\_TIMEOUT if TX is busy (polling).

*esp\_err\_t* **rmt\_get\_ringbuf\_handle** (*rmt\_channel\_t* channel, RingbufHandle\_t \*buf\_handle)  
Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `buf_handle`: Pointer to buffer handle to accept RX ringbuffer handle.

*esp\_err\_t* **rmt\_translator\_init** (*rmt\_channel\_t* channel, *sample\_to\_rmt\_t* fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**

- ESP\_FAIL Init fail.
- ESP\_OK Init success.

**Parameters**

- `channel`: RMT channel .
- `fn`: Point to the data conversion function.

*esp\_err\_t* **rmt\_write\_sample** (*rmt\_channel\_t* channel, **const** uint8\_t \*src, size\_t src\_size, bool wait\_tx\_done)

Translate uint8\_t type of data into rmt format and send it out. Requires `rmt_translator_init` to init the translator first.

**Return**

- ESP\_FAIL Send fail
- ESP\_OK Send success

**Parameters**

- `channel`: RMT channel .
- `src`: Pointer to the raw data.
- `src_size`: The size of the raw data.
- `wait_tx_done`: Set true to wait all data send done.

*rmt\_tx\_end\_callback\_t* **rmt\_register\_tx\_end\_callback** (*rmt\_tx\_end\_fn\_t* function, void \*arg)

Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

**Note** Requires `rmt_driver_install` to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**

- `function`: Function to be called from the default interrupt handler or NULL.

- `arg`: Argument which will be provided to the callback when it is called.

### Structures

#### **struct rmt\_tx\_config\_t**

Data struct of RMT TX configure parameters.

#### **Public Members**

`uint32_t carrier_freq_hz`

RMT carrier frequency

`rmt_carrier_level_t carrier_level`

Level of the RMT output, when the carrier is applied

`rmt_idle_level_t idle_level`

RMT idle level

`uint8_t carrier_duty_percent`

RMT carrier duty (%)

`bool carrier_en`

RMT carrier enable

`bool loop_en`

Enable sending RMT items in a loop

`bool idle_output_en`

RMT idle level output enable

#### **struct rmt\_rx\_config\_t**

Data struct of RMT RX configure parameters.

#### **Public Members**

`uint16_t idle_threshold`

RMT RX idle threshold

`uint8_t filter_ticks_thresh`

RMT filter tick number

`bool filter_en`

RMT receiver filter enable

#### **struct rmt\_config\_t**

Data struct of RMT configure parameters.

#### **Public Members**

`rmt_mode_t rmt_mode`

RMT mode: transmitter or receiver

`rmt_channel_t channel`

RMT channel

`gpio_num_t gpio_num`

RMT GPIO number

`uint8_t clk_div`

RMT channel counter divider

`uint8_t mem_block_num`

RMT memory block number

*rmt\_tx\_config\_t* **tx\_config**

RMT TX parameter

*rmt\_rx\_config\_t* **rx\_config**

RMT RX parameter

**struct rmt\_tx\_end\_callback\_t**

Structure encapsulating a RMT TX end callback.

### Public Members

*rmt\_tx\_end\_fn\_t* **function**

Function which is called on RMT TX end

void \***arg**

Optional argument passed to function

### Macros

**RMT\_MEM\_ITEM\_NUM**

Define memory space of each RMT channel (in words = 4 bytes)

**RMT\_DEFAULT\_CONFIG\_TX** (gpio, channel\_id)

Default configuration for Tx channel.

**RMT\_DEFAULT\_CONFIG\_RX** (gpio, channel\_id)

Default configuration for RX channel.

### Type Definitions

**typedef intr\_handle\_t rmt\_isr\_handle\_t**

RMT interrupt handle.

**typedef void (\*rmt\_tx\_end\_fn\_t) (rmt\_channel\_t channel, void \*arg)**

Type of RMT Tx End callback function.

**typedef void (\*sample\_to\_rmt\_t) (const void \*src, rmt\_item32\_t \*dest, size\_t src\_size, size\_t wanted\_num, size\_t \*translated\_size, size\_t \*item\_num)**

User callback function to convert uint8\_t type data to rmt format(rmt\_item32\_t).

This function may be called from an ISR, so, the code should be short and efficient.

**Note** In fact, item\_num should be a multiple of translated\_size, e.g. : When we convert each byte of uint8\_t type data to rmt format data, the relation between item\_num and translated\_size should be  $item\_num = translated\_size * 8$ .

### Parameters

- **src**: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- **[out] dest**: Pointer to the buffer storing the rmt format data.
- **src\_size**: The raw data size.
- **wanted\_num**: The number of rmt format data that wanted to get.
- **[out] translated\_size**: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- **[out] item\_num**: The number of the rmt format data that actually converted to, it can be less than wanted\_num if there is not enough raw data, but cannot exceed wanted\_num. it should return 0 if no data was converted.

### Header File

- [soc/include/hal/rmt\\_types.h](#)

### Structures

**struct rmt\_channel\_status\_result\_t**

Data struct of RMT channel status.

## Public Members

`rmt_channel_status_t status[RMT_CHANNEL_MAX]`  
Store the current status of each channel

## Type Definitions

`typedef rmt_channel_id_t rmt_channel_t`  
RMT Channel Type.

## Enumerations

`enum rmt_mem_owner_t`  
RMT Internal Memory Owner.

*Values:*

`RMT_MEM_OWNER_TX`  
RMT RX mode, RMT transmitter owns the memory block

`RMT_MEM_OWNER_RX`  
RMT RX mode, RMT receiver owns the memory block

`RMT_MEM_OWNER_MAX`

`enum rmt_source_clk_t`  
Clock Source of RMT Channel.

*Values:*

`RMT_BASECLK_REF`  
RMT source clock system reference tick, 1MHz by default (not supported in this version)

`RMT_BASECLK_APB`  
RMT source clock is APB CLK, 80Mhz by default

`RMT_BASECLK_MAX`

`enum rmt_data_mode_t`  
RMT Data Mode.

**Note** We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

*Values:*

`RMT_DATA_MODE_FIFO`

`RMT_DATA_MODE_MEM`

`RMT_DATA_MODE_MAX`

`enum rmt_mode_t`  
RMT Channel Working Mode (TX or RX)

*Values:*

`RMT_MODE_TX`  
RMT TX mode

`RMT_MODE_RX`  
RMT RX mode

`RMT_MODE_MAX`

`enum rmt_idle_level_t`  
RMT Idle Level.

*Values:*

**RMT\_IDLE\_LEVEL\_LOW**

RMT TX idle level: low Level

**RMT\_IDLE\_LEVEL\_HIGH**

RMT TX idle level: high Level

**RMT\_IDLE\_LEVEL\_MAX**

**enum rmt\_carrier\_level\_t**

RMT Carrier Level.

*Values:*

**RMT\_CARRIER\_LEVEL\_LOW**

RMT carrier wave is modulated for low Level output

**RMT\_CARRIER\_LEVEL\_HIGH**

RMT carrier wave is modulated for high Level output

**RMT\_CARRIER\_LEVEL\_MAX**

**enum rmt\_channel\_status\_t**

RMT Channel Status.

*Values:*

**RMT\_CHANNEL\_UNINIT**

RMT channel uninitialized

**RMT\_CHANNEL\_IDLE**

RMT channel status idle

**RMT\_CHANNEL\_BUSY**

RMT channel status busy

### 2.3.11 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see [MTDI Strapping Pin](#) below.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

#### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

### Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see [ESP32 datasheet](#)):
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2* for models with 3.3 V flash chip
- ESP32-D2WD:
  - *No Pull-ups*
  - *No Pull-up on GPIO12*

### Systems in Packages (SIP)

- ESP32-PICO-D4:
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*

### Modules

- ESP32-WROOM-32 Series, including ESP32-WROOM-32, ESP32-WROOM-32D, ESP32-WROOM-32U, and ESP32-SOLO-1
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - *No Pull-ups*
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*

### Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - *Pull-up Conflicts on GPIO13* (v4.1, v3, v2, and v1)
  - *Conflicts Between Bootstrap and SDIO on DAT2* (v4.1, v2, and v1)
  - *Download Mode Not Working (minor issue)* (v2, v1)

You can determine the version of your ESP23-WROVER-KIT by checking which module is mounted on it:

  - ESP32-WROVER-B on v4.1
  - ESP32-WROVER on v3
  - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSK
  - Required pull-ups are provided
  - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-LyraT
  - Required pull-ups are provided
  - *Pull-up Conflicts on GPIO13*

**Non-Esspressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

## Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13** If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device's DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2** There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator's output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on <http://www.espressif.com/>. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD\_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
``components/esptool_py/esptool/espefuse.py summary``
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`. For more details, see the [ESP32 Technical Reference Manual](#) (PDF).

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:
  - Leave the host's DAT2 floating and directly connect the slave's DAT2 to VDD.
  - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host's side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

### Related Information

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD\_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD\_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif's boards with the SD card operation, see [Overview of Compatibility](#).

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif's products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

Table 2: Default pull-up and pull-down states of the CMD and DATA pins

GPIO number	Pin Name	Startup State	Strapping Requirement
15	CMD	WPU	
2	DAT0	WPD	Low for Download mode
4	DAT1	WPD	
12	DAT2	PU for 1.8 V flash; WPD for 3.3 V flash	High for 1.8 V flash; Low for 3.3 V flash
13	DAT3	WPU	

## 2.3.12 SDMMC Host Driver

### Overview

ESP32's SDMMC host peripheral has two slots:

- Slot 0 (`SDMMC_HOST_SLOT_0`) is an 8-bit slot. It uses HS1\_\* signals in the PIN MUX.
- Slot 1 (`SDMMC_HOST_SLOT_1`) is a 4-bit slot. It uses HS2\_\* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.

Signal	Slot 0	Slot 1
CMD	GPIO11	GPIO15
CLK	GPIO6	GPIO14
D0	GPIO7	GPIO2
D1	GPIO8	GPIO4
D2	GPIO9	GPIO12
D3	GPIO10	GPIO13
D4	GPIO16	
D5	GPIO17	
D6	GPIO5	
D7	GPIO18	
CD	any input via GPIO matrix	
WP	any input via GPIO matrix	

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1\_\*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

### Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### See also

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol's SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

## API Reference

### Header File

- `driver/include/driver/sdmmc_host.h`

### Functions

`esp_err_t sdmmc_host_init` (void)

Initialize SDMMC host peripheral.

**Note** This function is not thread safe

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdmmc_host_init` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated

`esp_err_t sdmmc_host_init_slot` (int slot, const `sdmmc_slot_config_t` \*slot\_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1\_\* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2\_\* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if host has not been initialized using `sdmmc_host_init`

#### Parameters

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

- `slot_config`: additional configuration for the slot

*esp\_err\_t* `sdmmc_host_set_bus_width` (int *slot*, size\_t *width*)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. `SD_APP_SET_BUS_WIDTH`)

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if slot number or width is not valid

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

size\_t `sdmmc_host_get_slot_width` (int *slot*)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

*esp\_err\_t* `sdmmc_host_set_card_clk` (int *slot*, uint32\_t *freq\_khz*)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- other error codes may be returned in the future

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `freq_khz`: card clock frequency, in kHz

*esp\_err\_t* `sdmmc_host_set_bus_ddr_mode` (int *slot*, bool *ddr\_enabled*)

Enable or disable DDR mode of SD interface.

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if DDR mode is not supported on this slot

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `ddr_enabled`: enable or disable DDR mode

*esp\_err\_t* `sdmmc_host_do_transaction` (int *slot*, *sdmmc\_command\_t* \**cmdinfo*)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

**Attention** Data buffer passed in `cmdinfo->data` must be in DMA capable memory

**Return**

- `ESP_OK` on success
- `ESP_ERR_TIMEOUT` if response or data transfer has timed out
- `ESP_ERR_INVALID_CRC` if response or data transfer CRC check has failed
- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response
- `ESP_ERR_INVALID_SIZE` if the size of data transfer is not valid in SD protocol
- `ESP_ERR_INVALID_ARG` if the data buffer is not in DMA capable memory

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

- `cmdinfo`: pointer to structure describing command and data to transfer

*esp\_err\_t* **sdmmc\_host\_io\_int\_enable** (int *slot*)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns `ESP_OK`, other errors possible in the future

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

*esp\_err\_t* **sdmmc\_host\_io\_int\_wait** (int *slot*, TickType\_t *timeout\_ticks*)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**

- `ESP_OK` on success (interrupt received)
- `ESP_ERR_TIMEOUT` if the interrupt did not occur within `timeout_ticks`

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `timeout_ticks`: number of RTOS ticks to wait for the interrupt

*esp\_err\_t* **sdmmc\_host\_deinit** (void)

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdmmc_host_init` function has not been called

*esp\_err\_t* **sdmmc\_host\_pullup\_en** (int *slot*, int *width*)

Enable the pull-ups of sd pins.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**

- `ESP_OK`: if success
- `ESP_ERR_INVALID_ARG`: if configured width larger than maximum the slot can support

**Parameters**

- `slot`: Slot to use, normally set it to 1.
- `width`: Bit width of your configuration, 1 or 4.

## Structures

**struct** **sdmmc\_slot\_config\_t**

Extra configuration for SDMMC peripheral slot

### Public Members

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

uint8\_t **width**

Bus width used by the slot (might be less than the max width supported)

uint32\_t **flags**

Features used by this slot.

## Macros

### **SDMMC\_HOST\_SLOT\_0**

SDMMC slot 0.

### **SDMMC\_HOST\_SLOT\_1**

SDMMC slot 1.

### **SDMMC\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

### **SDMMC\_SLOT\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

### **SDMMC\_SLOT\_NO\_CD**

indicates that card detect line is not used

### **SDMMC\_SLOT\_NO\_WP**

indicates that write protect line is not used

### **SDMMC\_SLOT\_WIDTH\_DEFAULT**

use the default width for the slot (8 for slot 0, 4 for slot 1)

### **SDMMC\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SDMMC host slot

## 2.3.13 SD SPI Host Driver

### Overview

The SD SPI host driver allows using the SPI2 (HSPI) or SPI3 (VSPI) controller for communication with SD cards. This driver's naming pattern was adopted from the *SDMMC Host* driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

The SD SPI host driver has the following modes:

- **SPI mode:** offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral's signals can be routed to any ESP32 pin.
- **1-bit SD mode:** offers higher throughput but requires routing the signals through their dedicated IO\_MUX pins only.

The SD SPI driver uses software-controlled CS signal.

Currently, the SD SPI driver cannot handle multi-threaded environments as does not support time-division multiplexing on the same SPI bus. It means that if your application needs to communicate with an SD card and other devices on the same SPI bus, the application itself must ensure that its different tasks do not try to access the SPI slaves at the same time.

### How to Use

The state and configurations of the SD SPI host driver are stored in a *sdmmc\_host\_t* structure. This structure can be initialized using the *SDSPI\_HOST\_DEFAULT* macro.

The state and configurations of the SD slot are stored in a *sdmmc\_slot\_config\_t* structure. Use the macro *SDSPI\_SLOT\_CONFIG\_DEFAULT* to initialize the structure and to fill in the default pin mappings (SD mode pin mappings).

Only the following driver's API functions are normally used by most applications:

- *sdspi\_host\_init ()*
- *sdspi\_host\_init\_slot ()*
- *sdspi\_host\_deinit ()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [the SD/SDIO/MMC Driver](#).

---

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

## API Reference

### Header File

- `driver/include/driver/sdspi_host.h`

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_slot` (int slot, const `sdspi_slot_config_t` \*slot\_config)

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_init_slot` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

#### Parameters

- slot: SPI controller to use (HSPI\_HOST or VSPI\_HOST)
- slot\_config: pointer to slot configuration structure

`esp_err_t sdspi_host_do_transaction` (int slot, `sdmmc_command_t` \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

#### Return

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

#### Parameters

- slot: SPI controller (HSPI\_HOST or VSPI\_HOST)
- cmdinfo: pointer to structure describing command and data to transfer

`esp_err_t sdspi_host_set_card_clk` (int slot, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- other error codes may be returned in the future

**Parameters**

- `slot`: SPI controller (HSPI\_HOST or VSPI\_HOST)
- `freq_khz`: card clock frequency, in kHz

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

**Note** This function is not thread safe

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (int *slot*)

Enable SDIO interrupt.

**Return**

- ESP\_OK on success

**Parameters**

- `slot`: SPI controller to use (HSPI\_HOST or VSPI\_HOST)

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (int *slot*, TickType\_t *timeout\_ticks*)

Wait for SDIO interrupt until timeout.

**Return**

- ESP\_OK on success

**Parameters**

- `slot`: SPI controller to use (HSPI\_HOST or VSPI\_HOST)
- `timeout_ticks`: Ticks to wait before timeout.

**Structures**

**struct** **sdspi\_slot\_config\_t**

Extra configuration for SPI host

**Public Members**

*gpio\_num\_t* **gpio\_miso**

GPIO number of MISO signal.

*gpio\_num\_t* **gpio\_mosi**

GPIO number of MOSI signal.

*gpio\_num\_t* **gpio\_sck**

GPIO number of SCK signal.

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

int **dma\_channel**

DMA channel to be used by SPI driver (1 or 2)

**Macros****SDSPI\_HOST\_DEFAULT ()**

Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ can be set to one of HSPI\_HOST, VSPI\_HOST.

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SPI host

**2.3.14 SDIO Card Slave Driver****Overview**

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

**Connections**

Pin Name	Corresponding pins in SPI mode	Slot1	Slot2
		GPIO Number	
CLK	SCLK	6	14
CMD	MOSI	11	15
DAT0	MISO	7	2
DAT1	Interrupt	8	4
DAT2	N.C. (pullup)	9	12
DAT3	#CS	10	13

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**Note:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don't offer these pullups internally. If you are using official development boards, check [Overview of Compatibility](#) to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See [Overview of Compatibility](#) to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- Modules: ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB

- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

---

Refer to [SD Pull-up Requirements](#) for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology** The SDIO slave driver uses the following terms:

- Transfer: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

---

**Note:** Register names in ESP Rechnical Reference Manual are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using *tx* or *rx* in the driver to avoid ambiguities.

---

- FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: *requested length* = 0x1F800-address.
- Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
- Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

---

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the *requested length* rather than the *transfer length*. The *transfer length* should be no shorter than the *requested length*, and the rest part will be filled with 0 (sending) or discard (receiving).

---

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the `recv_buffer_size` member of `sdio_slave_config_t`.
- Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in [Interrupts](#).
- Registers: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)), which is described briefly in [ESP SDIO slave initialization](#).

Furthermore, there's an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to [ESP SDIO slave protocol](#). There is also a component [ESP Serial Slave Link](#) for ESP32 master to communicate with ESP32 SDIO slave, see example [peripherals/sdio](#) when programming your host.

### Communication with ESP SDIO Slave

**ESP SDIO slave initialization** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)). In this specification and below, the SDIO slave is also called an (SD)IO card. All the initialization CMD52 and CMD53 are sent to Func 0 (CIA region). Here is an brief example on how to do this:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000  
 CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)  
**Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFF00.  
 Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)  
**Example:** Arg of R6 after CMD3 is 0x0001xxxx.  
 Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)  
 CMD52/53 (Write 0x10=0x00)  
 CMD52/53 (Write 0x11=0x02)  
 CMD52/53 (Read 0x10~0x11, read to check the final value)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)  
 CMD52/53 (Write 0x110=0x00)  
 CMD52/53 (Write 0x111=0x02)  
 CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO slave protocol** The protocol is based on Function 1 access by CMD52 and CMD53, offering 3 services: (1) sending and receiving FIFO, (2) 52 8-bit R/W register shared by host and slave, (3) 8 general purpose interrupt sources from host to slave and 8 in the opposite direction.

There is a component [esp\\_serial\\_slave\\_link](#) implementing the logic of this protocol for ESP32 master to communicate with the ESP32 slave. See [ESP Serial Slave Link](#).

The host should access the registers below as described to communicate with slave.

### Slave register table

#### 32-bit

- 0x044 (TOKEN\_RDATA): in which bit 27-16 holds the receiving buffer number.
- 0x058 (INT\_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT\_LEN): holds the accumulated length (by byte) to be sent from slave to host.
- 0x0D4 (INT\_CLR): write 1 to clear interrupt bits corresponding to INT\_ST.
- 0x0DC (INT\_ENA): mask bits for interrupts from slave to host.

#### 8-bit Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.

- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE\_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)** 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from/write to the slave in a single transfer:

$$\text{requested length} = 0x1F800 - \text{address}$$

The slave will respond with the length according to the length field in CMD53, with the data longer than *requested length* filled with 0 (sending) or discard (receiving).

---

**Note:** This includes both the block and the byte mode of CMD53.

The function number should be set to 1, OP Code should be set to 1 (for CMD53).

It is allowed to use CMD53 mode combination of block+byte to get higher efficiency when accessing the FIFO by arbitrary length. E.g. The block size is set to 512 by default, you can write/get 1031 bytes of data to/from the FIFO by:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-**1031**.
  2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.
- 

**Interrupts** For the host interrupts, the slave raise the interrupt by pulling DAT1 line down at a proper time (level sensitive). The host detect this and read the INT\_ST register to see the source. Then the host can clear it by writing the INT\_CLR register and do something with the interrupt. The host can also mask unneeded sources by clearing the bits in INT\_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

sdio\_slave\_hostint\_t (*SDIO Card Slave Driver*) shows the bit definition corresponding to host interrupt sources.

For the slave interrupts, the host send transfers to write the SLAVE\_INT register. Once a bit is written from 0 to 1, the slave hardware and driver will detect it and inform the app.

**Receiving FIFO** To write the receiving FIFO in the slave, host should work in the following steps:

1. Read the TOKEN1 field (bits 27-16) of TOKEN\_RDATA (0x044) register. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient ( $\text{recv\_buffer\_size} * \text{buffer\_num}$  is greater than data to write, *recv\_buffer\_size* is pre-defined between the host and the slave before the communication starts). Or go back to step 1 until the buffer is enough.
3. Write to the FIFO address with CMD53. Note that the *requested length* should not be larger than calculated in step 2, and the FIFO address is related to *requested length*.
4. Calculate used buffers, note that non-full buffer at the tail should be seen as one that is used.

**Sending FIFO** To read the sending FIFO in the slave, host should work in the following steps:

1. Wait for the interrupt line to be active (optional, low by default).
2. Read (poll) the interrupt bits in INT\_ST register to see whether new packets exists.
3. If new packets are ready, reads the PKT\_LEN reg. The data length to read from slave is PKT\_LEN minuses the length that has been read from the host. If the PKT\_LEN is not larger than used, wait and poll until the slave is ready and update the PKT\_LEN.

4. Read from the FIFO with CMD53. Note that the *requested length* should not be larger than calculated in step3, and the FIFO address is related to *requested length*.
5. Recorded read length.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.

---

**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

---

There's another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Call `sdio_slave_recv` to get the received data. If non-blocking call is needed, set `wait=0`.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

---

**Note:** To avoid overhead from copying data, the driver itself doesn't have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

---

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself doesn't have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```
typedef struct {
    uint8_t* buffer;
    size_t   size;
    int      id;
}sdio_transfer_t;

//and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

//and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void**)&arg, portMAX_DELAY);
ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size,
↳arg->buffer);
some_post_callback(arg); //do more things
```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it's sent:

```
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_rcv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_rcv_load_buf(handle);
```

More about this, see [peripherals/sdio](#).

### Application Example

Slave/master communication: [peripherals/sdio](#).

### API Reference

#### Header File

- [soc/include/hal/sdio\\_slave\\_types.h](#)

#### Enumerations

##### **enum sdio\_slave\_hostint\_t**

Mask of interrupts sending to the host.

*Values:*

**SDIO\_SLAVE\_HOSTINT\_BIT0** = BIT(0)

General purpose interrupt bit 0.

**SDIO\_SLAVE\_HOSTINT\_BIT1** = BIT(1)

**SDIO\_SLAVE\_HOSTINT\_BIT2** = BIT(2)

**SDIO\_SLAVE\_HOSTINT\_BIT3** = BIT(3)

**SDIO\_SLAVE\_HOSTINT\_BIT4** = BIT(4)

**SDIO\_SLAVE\_HOSTINT\_BIT5** = BIT(5)

**SDIO\_SLAVE\_HOSTINT\_BIT6** = BIT(6)

**SDIO\_SLAVE\_HOSTINT\_BIT7** = BIT(7)

**SDIO\_SLAVE\_HOSTINT\_SEND\_NEW\_PACKET** = BIT(23)

New packet available.

##### **enum sdio\_slave\_timing\_t**

Timing of SDIO slave.

*Values:*

**SDIO\_SLAVE\_TIMING\_PSEND\_PSAMPLE** = 0

Send at posedge, and sample at posedge. Default value for HS mode. Normally there's no problem using this to work in DS mode.

**SDIO\_SLAVE\_TIMING\_NSEND\_PSAMPLE**

Send at negedge, and sample at posedge. Default value for DS mode and below.

**SDIO\_SLAVE\_TIMING\_PSEND\_NSAMPLE**

Send at posedge, and sample at negedge.

**SDIO\_SLAVE\_TIMING\_NSEND\_NSAMPLE**

Send at negedge, and sample at negedge.

##### **enum sdio\_slave\_sending\_mode\_t**

Configuration of SDIO slave mode.

*Values:*

**SDIO\_SLAVE\_SEND\_STREAM** = 0

Stream mode, all packets to send will be combined as one if possible.

**SDIO\_SLAVE\_SEND\_PACKET** = 1

Packet mode, one packets will be sent one after another (only increase packet\_len if last packet sent).

## Header File

- `driver/include/driver/sdio_slave.h`

## Functions

*esp\_err\_t* **sdio\_slave\_initialize** (*sdio\_slave\_config\_t* \**config*)

Initialize the sdio slave driver

### Return

- `ESP_ERR_NOT_FOUND` if no free interrupt found.
- `ESP_ERR_INVALID_STATE` if already initialized.
- `ESP_ERR_NO_MEM` if fail due to memory allocation failed.
- `ESP_OK` if success

### Parameters

- *config*: Configuration of the sdio slave driver.

void **sdio\_slave\_deinit** (void)

De-initialize the sdio slave driver to release the resources.

*esp\_err\_t* **sdio\_slave\_start** (void)

Start hardware for sending and receiving, as well as set the `IOREADY1` to 1.

**Note** The driver will continue sending from previous data and `PKT_LEN` counting, keep data received as well as start receiving from current `TOKEN1` counting. See `sdio_slave_reset`.

### Return

- `ESP_ERR_INVALID_STATE` if already started.
- `ESP_OK` otherwise.

void **sdio\_slave\_stop** (void)

Stop hardware from sending and receiving, also set `IOREADY1` to 0.

**Note** this will not clear the data already in the driver, and also not reset the `PKT_LEN` and `TOKEN1` counting. Call `sdio_slave_reset` to do that.

*esp\_err\_t* **sdio\_slave\_reset** (void)

Clear the data still in the driver, as well as reset the `PKT_LEN` and `TOKEN1` counting.

**Return** always return `ESP_OK`.

*sdio\_slave\_buf\_handle\_t* **sdio\_slave\_recv\_register\_buf** (uint8\_t \**start*)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return** The buffer handle if success, otherwise `NULL`.

### Parameters

- *start*: The start address of the buffer.

*esp\_err\_t* **sdio\_slave\_recv\_unregister\_buf** (*sdio\_slave\_buf\_handle\_t* *handle*)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return** `ESP_OK` if success, `ESP_ERR_INVALID_ARG` if the handle is `NULL` or the buffer is being used.

### Parameters

- *handle*: Handle to the buffer to release.

*esp\_err\_t* **sdio\_slave\_recv\_load\_buf** (*sdio\_slave\_buf\_handle\_t* *handle*)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

### Return

- `ESP_ERR_INVALID_ARG` if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- `ESP_OK` if success

**Parameters**

- `handle`: Handle to the buffer ready to receive data.

`esp_err_t sdio_slave_recv (sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)`

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**

- `ESP_ERR_INVALID_ARG` if `handle_ret` is NULL
- `ESP_ERR_TIMEOUT` if timeout before receiving new data
- `ESP_OK` if success

**Parameters**

- `handle_ret`: Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- [out] `out_addr`: Output of the start address, set to NULL if not needed.
- [out] `out_len`: Actual length of the data in the buffer, set to NULL if not needed.
- `wait`: Time to wait before data received.

`uint8_t *sdio_slave_recv_get_buf (sdio_slave_buf_handle_t handle, size_t *len_o)`

Retrieve the buffer corresponding to a handle.

**Return** buffer address if success, otherwise NULL.

**Parameters**

- `handle`: Handle to get the buffer.
- `len_o`: Output of buffer length

`esp_err_t sdio_slave_send_queue (uint8_t *addr, size_t len, void *arg, TickType_t wait)`

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**

- `ESP_ERR_INVALID_ARG` if the length is not greater than 0.
- `ESP_ERR_TIMEOUT` if the queue is still full until timeout.
- `ESP_OK` if success.

**Parameters**

- `addr`: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- `len`: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- `arg`: Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- `wait`: Time to wait if the buffer is full.

`esp_err_t sdio_slave_send_get_finished (void **out_arg, TickType_t wait)`

Return the ownership of a finished transaction.

**Return** `ESP_ERR_TIMEOUT` if no transaction finished, or `ESP_OK` if succeed.

**Parameters**

- `out_arg`: Argument of the finished transaction. Set to NULL if unused.
- `wait`: Time to wait if there's no finished sending transaction.

`esp_err_t sdio_slave_transmit (uint8_t *addr, size_t len)`

Start a new sending transfer, and wait for it (blocked) to be finished.

**Return**

- `ESP_ERR_INVALID_ARG` if the length of descriptor is not greater than 0.
- `ESP_ERR_TIMEOUT` if the queue is full or host do not start a transfer before timeout.
- `ESP_OK` if success.

**Parameters**

- `addr`: Start address of the buffer to send
- `len`: Length of buffer to send.

`uint8_t sdio_slave_read_reg` (int *pos*)

Read the spi slave register shared with host.

**Note** register 28 to 31 are reserved for interrupt vector.

**Return** value of the register.

**Parameters**

- *pos*: register address, 0-27 or 32-63.

`esp_err_t sdio_slave_write_reg` (int *pos*, uint8\_t *reg*)

Write the spi slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.

**Return** ESP\_ERR\_INVALID\_ARG if address wrong, otherwise ESP\_OK.

**Parameters**

- *pos*: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- *reg*: the value to write.

`sdio_slave_hostint_t sdio_slave_get_host_intena` (void)

Get the interrupt enable for host.

**Return** the interrupt mask.

void `sdio_slave_set_host_intena` (`sdio_slave_hostint_t` *mask*)

Set the interrupt enable for host.

**Parameters**

- *mask*: Enable mask for host interrupt.

`esp_err_t sdio_slave_send_host_int` (uint8\_t *pos*)

Interrupt the host by general purpose interrupt.

**Return**

- ESP\_ERR\_INVALID\_ARG if interrupt num error
- ESP\_OK otherwise

**Parameters**

- *pos*: Interrupt num, 0-7.

void `sdio_slave_clear_host_int` (`sdio_slave_hostint_t` *mask*)

Clear general purpose interrupt to host.

**Parameters**

- *mask*: Interrupt bits to clear, by bit mask.

`esp_err_t sdio_slave_wait_int` (int *pos*, TickType\_t *wait*)

Wait for general purpose interrupt from host.

**Note** this clears the interrupt at the same time.

**Return** ESP\_OK if success, ESP\_ERR\_TIMEOUT if timeout.

**Parameters**

- *pos*: Interrupt source number to wait for. is set.
- *wait*: Time to wait before interrupt triggered.

## Structures

`struct sdio_slave_config_t`

Configuration of SDIO slave.

## Public Members

`sdio_slave_timing_t timing`

timing of `sdio_slave`. see `sdio_slave_timing_t`.

`sdio_slave_sending_mode_t sending_mode`

mode of `sdio_slave`. SDIO\_SLAVE\_MODE\_STREAM if the data needs to be sent as much as possible; SDIO\_SLAVE\_MODE\_PACKET if the data should be sent in packets.

int **send\_queue\_size**

max buffers that can be queued before sending.

size\_t **recv\_buffer\_size**

If `buffer_size` is too small, it costs more CPU time to handle larger number of buffers. If `buffer_size` is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

*sdio\_event\_cb\_t* **event\_cb**

when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32\_t **flags**

Features to be enabled for the slave, combinations of `SDIO_SLAVE_FLAG_*`.

## Macros

**SDIO\_SLAVE\_RECV\_MAX\_BUFFER**

**SDIO\_SLAVE\_FLAG\_DAT2\_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_HOST\_INTR\_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

## Type Definitions

**typedef** void (\**sdio\_event\_cb\_t*) (uint8\_t event)

**typedef** void \**sdio\_slave\_buf\_handle\_t*

Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

## 2.3.15 Sigma-delta Modulation

### Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

### Functionality Overview

There are eight independent sigma-delta modulation channels identified with *sigmadelta\_channel\_t*. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in *sigmadelta\_config\_t* and then applying this configuration with *sigmadelta\_config()*.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

### Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

### API Reference

#### Header File

- [driver/include/driver/sigmadelta.h](#)

#### Functions

`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`

Configure Sigma-delta channel.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

##### Parameters

- `config`: Pointer of Sigma-delta channel configuration struct

`esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)`

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be  $V_{dc} = V_{DDIO} / 256 * duty + V_{DDIO}/2$ , where VDDIO is the power supply voltage.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

##### Parameters

- `channel`: Sigma-delta channel number
- `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

`esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)`

Set Sigma-delta channel's clock pre-scale value. The source clock is APP\_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP\_CLK / pre\_scale.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

##### Parameters

- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)`

Set Sigma-delta signal output pin.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `channel`: Sigma-delta channel number
- `gpio_num`: GPIO number of output pin.

**Header File**

- [soc/include/hal/sigmadelta\\_types.h](#)

**Structures****struct sigmadelta\_config\_t**

Sigma-delta configure struct.

**Public Members***sigmadelta\_channel\_t* **channel**

Sigma-delta channel number

**int8\_t sigmadelta\_duty**

Sigma-delta duty, duty ranges from -128 to 127.

**uint8\_t sigmadelta\_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

**uint8\_t sigmadelta\_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

**Type Definitions****typedef int sigmadelta\_port\_t**

SIGMADELTA port number, the max port number is (SIGMADELTA\_NUM\_MAX -1).

**typedef int sigmadelta\_channel\_t**

Sigma-delta channel list.

## 2.3.16 SPI Master Driver

SPI Master driver is a program that controls ESP32's SPI peripherals while they function as masters.

**Overview of ESP32's SPI peripherals**

ESP32 integrates four SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32's attached flash memory and thus are currently not open to users. They share one signal bus via an arbiter.
- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. Each bus has three CS lines to drive up to three SPI slaves.

**Terminology**

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master. This may be the SPI2 or SPI3 peripheral. (The driver will also support the SPI1 peripheral in the future.)
<b>Device</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• <b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• <b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
• <b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• <b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• <b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• <b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
• <b>Assertion</b>	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

### Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Command</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Address</b>	In this phase, an address (0-64 bit) is transmitted over the bus by the Host.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction intervals. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

---

**Note:** Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see *Known Issues*.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:

- **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
- **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

## GPIO Matrix and IO\_MUX

Most of ESP32's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO\_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO\_MUX pins are used.

---

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

---

The IO\_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

## Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Interval** Transaction interval is the time that software requires to set up SPI peripheral registers and to copy data to FIFOs, or to set up DMA links.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the interval. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction interval timings for one byte of data are given below.

	Typical Transaction Time (us)	
	Interrupt	Polling
DMA	24	8
No DMA	22	7

**SPI Clock Frequency** Transferring each byte takes eight times the clock period  $8/f_{spi}$ . If the clock frequency is too high, the use of some functions might be limited. See [Timing Considerations](#).

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from the cache miss and will need to wait until the code is read from the flash. Select [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache miss.

For an interrupt transaction, the overall cost is  $20+8n/F_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

### Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is  $< 0$ , and the setup timing requirement is violated, which results in the failure to perform the reading correctly.

The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the `IO_MUX` pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing *input delay*. To retain a higher frequency, you have to use the `IO_MUX` pins or the *dummy bit workaround*. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

Frequency Limit (MHz)		Dummy Bits Used By Driver	Comments
GPIO matrix	IO_MUX pins		
26.6	80	No	
40	–	Yes	Half-duplex, no DMA allowed

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver can work even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device's specification or measure the time on an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and the excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to the input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table.

Device	Input delay (ns)
Ideal Device	0
ESP32 slave using <code>IO_MUX</code> *	50
ESP32 slave using <code>GPIO_MUX</code> *	75
ESP32's slave device is on a different physical chip.	

The MISO path delay (valid time) consists of a slave's *input delay* plus master's *GPIO matrix delay*. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

$$Freq\ limit\ [MHz] = 80 / (\text{floor}(MISO\ delay[ns]/12.5) + 1)$$

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different *input delay* times are shown in the table below.

Master	Input delay (ns)	MISO path delay (ns)	Freq. limit (MHz)
IO_MUX (0ns)	0	0	80
	50	50	16
	75	75	11.43
GPIO (25ns)	0	25	26.67
	50	75	11.43
	75	100	8.89

### Known Issues

- Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
  - Use full-duplex transactions instead.
  - Disable DMA by setting the bus initialization function's last parameter to 0 as follows:

```
ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
```

This can prohibit you from transmitting and receiving data longer than 64 bytes.
  - Try using the command and address fields to replace the write phase.
- Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See [dummy bit speed-up workaround](#).
- `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

## Application Example

The code example for displaying graphics on an ESP32-WROVER-KIT's 320x240 LCD screen can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [soc/include/hal/spi\\_types.h](#)

### Enumerations

#### `enum spi_host_device_t`

Enum with the three SPI peripherals that are software-accessible in it.

Values:

`SPI1_HOST = 0`  
SPI1.

`SPI2_HOST = 1`  
SPI2.

`SPI3_HOST = 2`  
SPI3.

### Header File

- [driver/include/driver/spi\\_common.h](#)

### Functions

`esp_err_t spi_bus_initialize` (*spi\_host\_device\_t* host, **const** *spi\_bus\_config\_t* \*bus\_config, int dma\_chan)

Initialize a SPI bus.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

#### Parameters

- host: SPI peripheral that controls this bus
- bus\_config: Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- dma\_chan: Either channel 1 or 2, or 0 in the case when no DMA is required. Selecting a DMA channel for a SPI bus allows transfers on the bus to have sizes only limited by the amount of internal memory. Selecting no DMA channel (by passing the value 0) limits the amount of bytes transferred to a maximum of 64. Set to 0 if only the SPI flash uses this bus.

`esp_err_t spi_bus_free` (*spi\_host\_device\_t* host)

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed

- ESP\_OK on success

#### Parameters

- `host`: SPI peripheral to free

### Structures

#### struct spi\_bus\_config\_t

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

#### Public Members

##### int mosi\_io\_num

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

##### int miso\_io\_num

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

##### int sclk\_io\_num

GPIO pin for Spi CLoCK signal, or -1 if not used.

##### int quadwp\_io\_num

GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.

##### int quadhd\_io\_num

GPIO pin for HD (HoLD) signal which is used as D3 in 4-bit communication modes, or -1 if not used.

##### int max\_transfer\_sz

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE if DMA is disabled.

##### uint32\_t flags

Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON\_BUSFLAG\_\* flags.

##### int intr\_flags

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP\_INTR\_FLAG\_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

### Macros

#### SPI\_MAX\_DMA\_LEN

#### SPI\_SWAP\_DATA\_TX (DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

#### Parameters

- `DATA`: Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- `LEN`: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

**Parameters**

- DATA: Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****API Reference - SPI Master****Header File**

- [driver/include/driver/spi\\_master.h](#)

**Functions**

`esp_err_t spi_bus_add_device` (*spi\_host\_device\_t* host, **const** *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_FOUND if host doesn't have any free CS slots
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Parameters**

- `host`: SPI peripheral to allocate device on
- `dev_config`: SPI interface protocol config for the device
- `handle`: Pointer to variable to hold the device handle

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle to free

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \**trans\_desc*, TickType\_t *ticks\_to\_wait*)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\**trans\_desc*, TickType\_t *ticks\_to\_wait*)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \**trans\_desc*)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

`esp_err_t spi_device_polling_start` (`spi_device_handle_t handle`, `spi_transaction_t *trans_desc`, `TickType_t ticks_to_wait`)

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

`esp_err_t spi_device_polling_end` (`spi_device_handle_t handle`, `TickType_t ticks_to_wait`)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

`esp_err_t spi_device_polling_transmit` (`spi_device_handle_t handle`, `spi_transaction_t *trans_desc`)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

`esp_err_t spi_device_acquire_bus` (`spi_device_handle_t device`, `TickType_t wait`)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

**Parameters**

- `device`: The device to occupy the bus.

- `wait`: Time to wait before the the bus is occupied by the device. Currently MUST set to `port-MAX_DELAY`.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t dev*)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

#### Parameters

- `dev`: The device to release the bus.

int **spi\_cal\_clock** (int *fapb*, int *hz*, int *duty\_cycle*, uint32\_t \**reg\_o*)

Calculate the working frequency that is most close to desired frequency, and also the register value.

#### Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock
- `reg_o`: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

int **spi\_get\_actual\_clock** (int *fapb*, int *hz*, int *duty\_cycle*)

Calculate the working frequency that is most close to desired frequency.

**Return** Actual working frequency that most fit.

#### Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock

void **spi\_get\_timing** (bool *gpio\_is\_used*, int *input\_delay\_ns*, int *eff\_clk*, int \**dummy\_o*, int \**cycles\_remain\_o*)

Calculate the timing settings of specified frequency and settings.

**Note** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

#### Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
- `eff_clk`: Effective clock frequency (in Hz) from `spi_cal_clock`.
- `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool *gpio\_is\_used*, int *input\_delay\_ns*)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

#### Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

## Structures

**struct spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

## Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not

used, otherwise ignored.

**uint8\_t address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

**uint8\_t dummy\_bits**

Amount of dummy bits to insert between address and data phase.

**uint8\_t mode**

SPI mode (0-3)

**uint16\_t duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16\_t cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8\_t cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock\_speed\_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t pre\_cb***

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t post\_cb***

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members****uint32\_t flags**

Bitwise OR of `SPI_TRANS_*` flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**size\_t length**

Total data length, in bits.

**size\_t rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**uint8\_t tx\_data[4]**

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

**uint8\_t rx\_data[4]**

If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

**struct spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

**Public Members****struct spi\_transaction\_t base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

**uint8\_t command\_bits**

The command length in this transaction, in bits.

**uint8\_t address\_bits**

The address length in this transaction, in bits.

**uint8\_t dummy\_bits**

The dummy length in this transaction, in bits.

**Macros****SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz). 8MHz

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK****SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the command\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the address\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the dummy\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_SET\_CD**

Set the CD pin.

**Type Definitions**

```
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t) (spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t  
    Handle for a device on a SPI bus.
```

### 2.3.17 SPI Slave Driver

SPI Slave driver is a program that controls ESP32' s SPI peripherals while they function as slaves.

#### Overview of ESP32' s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

#### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>Device</b>	SPI slave device, in this case the SPI2 and SPI3 controllers. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• <b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• <b>MOSI</b>	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• <b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• <b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• <b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• <b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
• <b>Assertion</b>	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

### Driver Features

The SPI slave driver allows using the SPI2 and/or SPI3 peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

### Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`. If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

### Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**Warning:** The ESP32 DMA hardware has a limit to the number of bytes sent by a Host and received by a Device. The transaction length must be longer than 8 bytes and a multiple of 4 bytes; otherwise, the SPI hardware might fail to receive the last 1 to 7 bytes.

### GPIO Matrix and IO\_MUX

Most of ESP32's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO\_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO\_MUX pins.

---

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

---

The IO\_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

### Speed and Timing Considerations

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

	Output delay of MISO (ns)	Freq. limit (MHz)
IO_MUX	43.75	<11.4
GPIO matrix	68.75	<7.2

**Note:**

1. If the frequency is equal to the limitation, it can lead to random errors.
2. The clock uncertainty between Host and Device (12.5ns) is included.
3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge than expected, or configurable latching time.

## Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.
2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

If DMA is enabled, a Device's launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master's actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

## Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

## API Reference

### Header File

- [driver/include/driver/spi\\_slave.h](#)

### Functions

```
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,  
                             const spi_slave_interface_config_t *slave_config, int dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

#### Parameters

- `host`: SPI peripheral to use as a SPI slave interface
- `bus_config`: Pointer to a [spi\\_bus\\_config\\_t](#) struct specifying how the host should be initialized
- `slave_config`: Pointer to a [spi\\_slave\\_interface\\_config\\_t](#) struct specifying the details for the slave interface
- `dma_chan`: Either 1 or 2. A SPI bus used by this driver must have a DMA channel associated with it. The SPI hardware has two DMA channels to share. This parameter indicates which one to use.

```
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to free

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* *host*, **const** *spi\_slave\_transaction\_t* *\*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral that is acting as a slave
- *trans\_desc*: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- *ticks\_to\_wait*: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* *host*, *spi\_slave\_transaction\_t* *\*\*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to that is acting as a slave
- [*out*] *trans\_desc*: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- *ticks\_to\_wait*: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* *host*, *spi\_slave\_transaction\_t* *\*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to that is acting as a slave
- *trans\_desc*: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.

- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

### Structures

#### **struct spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

#### Public Members

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of `SPI_SLAVE_*` flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8\_t **mode**

SPI mode (0-3)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

*slave\_transaction\_cb\_t* **post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### **struct spi\_slave\_transaction\_t**

This structure describes one SPI transaction

#### Public Members

size\_t **length**

Total data length, in bits.

size\_t **trans\_len**

Transaction data length, in bits.

const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void \***rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void \***user**

User-defined variable. Can be used to store eg transaction ID.

### Macros

#### **SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

#### **SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**Type Definitions**

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t) (spi_slave_transaction_t *trans)
```

## 2.3.18 ESP32-S2 Temperature Sensor

**Overview**

The ESP32-S2 has a built-in temperature sensor. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC. The conversion relationship is the first columns of the table below. Among them, offset = 0 is the main measurement option, and other values are extended measurement options.

offset	measure range(Celsius)	measure error(Celsius)
-2	50 ~ 125	< 3
-1	20 ~ 100	< 2
0	-10 ~ 80	< 1
1	-30 ~ 50	< 2
2	-40 ~ 20	< 3

**Application Example**

Temperature sensor reading example: [peripherals/temp\\_sensor\\_esp32s2](#).

**API Reference - Normal Temp Sensor****Header File**

- [driver/esp32s2beta/include/temp\\_sensor.h](#)

**Functions**

*esp\_err\_t* **temp\_sensor\_set\_config** (*temp\_sensor\_config\_t* tsens)

Set parameter of temperature sensor.

**Return**

- ESP\_OK Success

**Parameters**

- tsens:

*esp\_err\_t* **temp\_sensor\_get\_config** (*temp\_sensor\_config\_t* \*tsens)

Get parameter of temperature sensor.

**Return**

- ESP\_OK Success

**Parameters**

- tsens:

*esp\_err\_t* **temp\_sensor\_start** (void)

Start temperature sensor measure.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **temp\_sensor\_stop** (void)

Stop temperature sensor measure.

**Return**

- ESP\_OK Success

*esp\_err\_t* **temp\_sensor\_read\_raw** (uint32\_t \**tsens\_out*)

Read temperature sensor raw data.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG *tsens\_out* is NULL
- ESP\_ERR\_INVALID\_STATE temperature sensor dont start

**Parameters**

- *tsens\_out*: Pointer to raw data, Range: 0 ~ 255

*esp\_err\_t* **temp\_sensor\_read\_celsius** (float \**celsius*)

Read temperature sensor data that is converted to degrees Celsius.

**Note** Should not be called from interrupt.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG ARG is NULL.
- ESP\_ERR\_INVALID\_STATE The ambient temperature is out of range.

**Parameters**

- *celsius*: The measure output value.

**Structures**

**struct temp\_sensor\_config\_t**

Configuration for temperature sensor reading.

**Public Members**

*temp\_sensor\_dac\_offset\_t* **dac\_offset**

The temperature measurement range is configured with a built-in temperature offset DAC.

uint8\_t **clk\_div**

Default: 6

**Macros**

**TSENS\_CONFIG\_DEFAULT** ()

**Enumerations**

**enum temp\_sensor\_dac\_offset\_t**

*Values:*

**TSENS\_DAC\_L0** = 0

offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

**TSENS\_DAC\_L1**

offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

**TSENS\_DAC\_L2**

offset = 0, measure range:-10°C ~ 80°C, error < 1°C.

**TSENS\_DAC\_L3**

offset = 1, measure range:-30°C ~ 50°C, error < 2°C.

**TSENS\_DAC\_L4**

offset = 2, measure range:-40°C ~ 20°C, error < 3°C.

**TSENS\_DAC\_MAX**

**TSENS\_DAC\_DEFAULT** = *TSENS\_DAC\_L2*

## 2.3.19 Timer

### Introduction

The ESP32 chip contains two hardware timer groups. Each group has two general-purpose hardware timers. They are all 64-bit generic timers based on 16-bit prescalers and 64-bit up / down counters which are capable of being auto-reloaded.

### Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- *Timer Initialization* - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- *Timer Control* - describes how to read a timer's value, pause or start a timer, and change how it operates.
- *Alarms* - shows how to set and use alarms.
- *Interrupts* - explains how to enable and use interrupts.

**Timer Initialization** The two ESP32 timer groups, with two timers in each, provide the total of four individual timers for use. An ESP32 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Divider:** Sets how quickly the timer's counter is "ticking". The setting `divider` is used as a divisor of the incoming 80 MHz APB\_CLK clock.
- **Mode:** Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable:** If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable:** Can be set using `alarm_en`.
- **Auto Reload:** Sets if the counter should `auto_reload` the initial counter value on the timer's alarm or continue incrementing or decrementing.
- **Interrupt Type:** Select which interrupt type should be triggered on the timer's alarm. Set the value defined in `timer_intr_mode_t`.

To get the current values of the timer's settings, use the function `timer_get_config()`.

**Timer Control** Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to `true`, or call `timer_start()`. You can specify the timer's initial counter value by calling `timer_set_counter_value()`. To check the timer's current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section *Timer Initialization*.

You can also reconfigure the timer by using dedicated functions to change individual settings:

Setting	Dedicated Function	Description
Divider	<code>timer_set_divider()</code>	Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.
Mode	<code>timer_set_counter_mode()</code>	Set if the counter should be incrementing or decrementing
Auto Reload	<code>timer_set_auto_reload()</code>	Set if the initial counter value should be reloaded on the timer's alarm

**Alarms** To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section [Interrupts](#) on how to configure interrupts.
- When `auto_reload` is enabled, the timer's counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

---

#### Note:

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
  - Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.
- 

To check the specified alarm value, call `timer_get_alarm_value()`.

**Interrupts** Registration of the interrupt handler for a specific timer or a timer group can be done by calling `timer_isr_register()`.

To enable interrupts for a timer group, call `timer_group_intr_enable()`, for a specific timer call `timer_enable_intr()`. To disable interrupts for a timer group, call `timer_group_intr_disable()`, for a specified timer, call `timer_disable_intr()`.

When handling an interrupt within an interrupt service routine (ISR), the interrupt status bit needs to be explicitly cleared. To do that, set the `TIMERGN.int_clr_timers.tM` structure, defined in `soc/esp32/include/soc/timer_group_struct.h`. In this structure, N is the timer group number [0, 1], M is the timer number [0, 1]. For example, to clear an interrupt status bit for the timer 1 in the timer group 0, call the following:

```
TIMERG0.int_clr_timers.t1 = 1
```

For more information on how to use interrupts, please see the application example below.

### Application Example

The 64-bit hardware timer example: [peripherals/timer\\_group](#).

### API Reference

#### Header File

- `driver/include/driver/timer.h`

**Functions**

*esp\_err\_t* **timer\_get\_counter\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t \*timer\_val)

Read the counter value of hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- timer\_val: Pointer to accept timer counter value.

*esp\_err\_t* **timer\_get\_counter\_time\_sec** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, double \*time)

Read the counter value of hardware timer, in unit of a given scale.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- time: Pointer, type of double\*, to accept timer counter value, in seconds.

*esp\_err\_t* **timer\_set\_counter\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t load\_val)

Set counter value to hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- load\_val: Counter value to write to the hardware timer.

*esp\_err\_t* **timer\_start** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Start the counter of hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

*esp\_err\_t* **timer\_pause** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Pause the counter of hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

*esp\_err\_t* **timer\_set\_counter\_mode** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_count\_dir\_t* counter\_dir)

Set counting mode for hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `counter_dir`: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload(timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)`

Enable or disable counter reload function when alarm event occurs.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `reload`: Counter reload mode.

`esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)`

Set hardware timer source clock divider. Timer groups clock are divider from APB clock.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `divider`: Timer clock divider value. The divider's range is from 2 to 65536.

`esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)`

Set timer alarm value.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: A 64-bit value to set the alarm value.

`esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)`

Get timer alarm value.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: Pointer of A 64-bit value to accept the alarm value.

`esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)`

Enable or disable generation of timer alarm events.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_en`: To enable or disable timer alarm function.

*esp\_err\_t* **timer\_isr\_callback\_add** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_isr\_t* isr\_handler, void \*arg, int intr\_alloc\_flags)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

**Note** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call `timer_isr_register(...)` to register ISR.

**Parameters**

- group\_num: Timer group number
- timer\_num: Timer index of timer group
- isr\_handler: Interrupt handler function, it is a callback function.
- arg: Parameter for handler function
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_isr\_callback\_remove** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Remove ISR handle callback for the corresponding timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number
- timer\_num: Timer index of timer group

*esp\_err\_t* **timer\_isr\_register** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, void (\*fn)() void \*, void \*arg, int intr\_alloc\_flags, *timer\_isr\_handle\_t* \*handle) Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

**Note** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(...)` before your handling, and call `timer_spinlock_give(...)` after your handling.

**Parameters**

- group\_num: Timer group number
- timer\_num: Timer index of timer group
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_init** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, const *timer\_config\_t* \*config)

Initializes and configure the timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer to timer initialization parameters.

*esp\_err\_t* **timer\_deinit** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Deinitializes the timer.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

*esp\_err\_t* **timer\_get\_config** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_config\_t* \*config)

Get timer configure value.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer of struct to accept timer parameters.

*esp\_err\_t* **timer\_group\_intr\_enable** (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Enable timer group interrupt, by enable mask.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt enable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

*esp\_err\_t* **timer\_group\_intr\_disable** (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Disable timer group interrupt, by disable mask.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt disable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

*esp\_err\_t* **timer\_enable\_intr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Enable timer interrupt.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

*esp\_err\_t* **timer\_disable\_intr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Disable timer interrupt.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_intr_clr_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Clear timer interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_clr_intr_status_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Clear timer interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_enable_alarm_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Enable alarm interrupt, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

uint64\_t `timer_group_get_counter_value_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Get the current counter value, just used in ISR.

**Return**

- Counter value

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_set_alarm_value_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`,  
uint64\_t `alarm_val`)

Set the alarm threshold for the timer, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.
- `alarm_val`: Alarm threshold.

void `timer_group_set_counter_enable_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`,  
*timer\_start\_t* `counter_en`)

Enable/disable a counter, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

- counter\_en: Enable/disable.

*timer\_intr\_t* **timer\_group\_intr\_get\_in\_isr** (*timer\_group\_t* group\_num)

Get the masked interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

uint32\_t **timer\_group\_get\_intr\_status\_in\_isr** (*timer\_group\_t* group\_num)

Get interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

void **timer\_group\_clr\_intr\_sta\_in\_isr** (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Clear the masked interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- intr\_mask: Masked interrupt.

bool **timer\_group\_get\_auto\_reload\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Get auto reload enable status, just used in ISR.

**Return**

- True Auto reload enabled
- False Auto reload disabled

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index

*esp\_err\_t* **timer\_spinlock\_take** (*timer\_group\_t* group\_num)

Take timer spinlock to enter critical protect.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

*esp\_err\_t* **timer\_spinlock\_give** (*timer\_group\_t* group\_num)

Give timer spinlock to exit critical protect.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

## Macros

**TIMER\_BASE\_CLK**

Frequency of the clock on the input of the timer groups

## Type Definitions

**typedef** bool (\**timer\_isr\_t*) (void \*)

Interrupt handle callback function. User need to retrun a bool value in callback.

**Return**

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

**Note** If you called FreeRTOS functions in callback, you need to return true or false based on the return value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

**typedef** *intr\_handle\_t* **timer\_isr\_handle\_t**

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

**Header File**

- `soc/include/hal/timer_types.h`

**Structures**

**struct** **timer\_config\_t**

Data structure with timer's configuration settings.

**Public Members**

*timer\_alarm\_t* **alarm\_en**

Timer alarm enable

*timer\_start\_t* **counter\_en**

Counter enable

*timer\_intr\_mode\_t* **intr\_type**

Interrupt mode

*timer\_count\_dir\_t* **counter\_dir**

Counter direction

*timer\_autoreload\_t* **auto\_reload**

Timer auto-reload

*uint32\_t* **divider**

Counter clock divider. The divider's range is from 2 to 65536.

**Enumerations**

**enum** **timer\_group\_t**

Selects a Timer-Group out of 2 available groups.

*Values:*

**TIMER\_GROUP\_0** = 0

Hw timer group 0

**TIMER\_GROUP\_1** = 1

Hw timer group 1

**TIMER\_GROUP\_MAX**

**enum** **timer\_idx\_t**

Select a hardware timer from timer groups.

*Values:*

**TIMER\_0** = 0

Select timer0 of GROUPx

**TIMER\_1** = 1

Select timer1 of GROUPx

**TIMER\_MAX****enum timer\_count\_dir\_t**

Decides the direction of counter.

*Values:*

**TIMER\_COUNT\_DOWN** = 0

Descending Count from cnt.higlcnt.low

**TIMER\_COUNT\_UP** = 1

Ascending Count from Zero

**TIMER\_COUNT\_MAX****enum timer\_start\_t**

Decides whether timer is on or paused.

*Values:*

**TIMER\_PAUSE** = 0

Pause timer counter

**TIMER\_START** = 1

Start timer counter

**enum timer\_intr\_t**

Interrupt types of the timer.

*Values:*

**TIMER\_INTR\_T0** = BIT(0)

interrupt of timer 0

**TIMER\_INTR\_T1** = BIT(1)

interrupt of timer 1

**TIMER\_INTR\_WDT** = BIT(2)

interrupt of watchdog

**TIMER\_INTR\_NONE** = 0

**enum timer\_wdt\_behavior\_t**

Behavior of the watchdog if a stage times out.

*Values:*

**TIMER\_WDT\_OFF** = 0

The stage is turned off

**TIMER\_WDT\_INT** = 1

The stage will trigger an interrupt

**TIMER\_WDT\_RESET\_CPU** = 2

The stage will reset the CPU

**TIMER\_WDT\_RESET\_SYSTEM** = 3

The stage will reset the whole system

**enum timer\_alarm\_t**

Decides whether to enable alarm mode.

*Values:*

**TIMER\_ALARM\_DIS** = 0

Disable timer alarm

**TIMER\_ALARM\_EN** = 1

Enable timer alarm

**TIMER\_ALARM\_MAX**

**enum timer\_intr\_mode\_t**

Select interrupt type if running in alarm mode.

*Values:*

**TIMER\_INTR\_LEVEL = 0**

Interrupt mode: level mode

**TIMER\_INTR\_MAX**

**enum timer\_autoreload\_t**

Select if Alarm needs to be loaded by software or automatically reload by hardware.

*Values:*

**TIMER\_AUTORELOAD\_DIS = 0**

Disable auto-reload: hardware will not load counter value after an alarm event

**TIMER\_AUTORELOAD\_EN = 1**

Enable auto-reload: hardware will load counter value after an alarm event

**TIMER\_AUTORELOAD\_MAX**

## 2.3.20 Touch Sensor

### Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

ESP32 can handle up to 10 capacitive touch pads / GPIOs. The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

Design, operation, and control registers of a touch sensor are discussed in [ESP32 Technical Reference Manual \(PDF\)](#). Please refer to this manual for additional details on how this subsystem works.

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in [Touch Sensor Application Note](#). If you want to test touch sensors in various configurations without building them on your own, check the [Guide for ESP32-Sense Development Kit](#).

### Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section [API Reference](#). Practical implementation of this API is covered in Section [Application Examples](#).

**Initialization** Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several `.._DEFAULT` driver parameters listed in [API Reference](#) under *Macros*. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

**Configuration** Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`.

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements** The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

---

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section *Filtering of Measurements*.

---

For the demonstration of how to use both read functions, check the application example [peripherals/touch\\_pad\\_read](#).

**Optimization of Measurements** A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

The last chart *Output* represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to *set* a specific parameter and to *get* the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Fig. 22: Touch pad - relationship between measurement parameters

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see [peripherals/touch\\_pad\\_interrupt](#).

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in *Touch State Measurements* to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

---

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see *Filtering of Measurements*) does not affect this process.

---

**Wakeup from Sleep Mode** If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each 'SET' with:

- `touch_pad_set_group_mask () / touch_pad_get_group_mask ()`
- `touch_pad_clear_group_mask ()`

### Application Examples

- Touch sensor read example: [peripherals/touch\\_pad\\_read](#).
- Touch sensor interrupt example: [peripherals/touch\\_pad\\_interrupt](#).

## Macros

**TOUCH\_PAD\_SLOPE\_DEFAULT**

**TOUCH\_PAD\_TIE\_OPT\_DEFAULT**

**TOUCH\_PAD\_BIT\_MASK\_MAX**

**TOUCH\_PAD\_HIGH\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_LOW\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_ATTEN\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_INACTIVE\_CONNECT\_DEFAULT**

**TOUCH\_PAD\_THRESHOLD\_MAX**

If set touch threshold max value, The touch sensor can't be in touched status

## Enumerations

**enum touch\_pad\_t**

*Values:*

**TOUCH\_PAD\_NUM0 = 0**

Touch pad channel 0 is GPIO4(ESP32)

**TOUCH\_PAD\_NUM1**

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

**TOUCH\_PAD\_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

**TOUCH\_PAD\_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

**TOUCH\_PAD\_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

**TOUCH\_PAD\_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

**TOUCH\_PAD\_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

**TOUCH\_PAD\_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

**TOUCH\_PAD\_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

**TOUCH\_PAD\_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

**TOUCH\_PAD\_MAX**

**enum touch\_high\_volt\_t**

*Values:*

**TOUCH\_HVOLT\_KEEP = -1**

Touch sensor high reference voltage, no change

**TOUCH\_HVOLT\_2V4 = 0**

Touch sensor high reference voltage, 2.4V

**TOUCH\_HVOLT\_2V5**

Touch sensor high reference voltage, 2.5V

**TOUCH\_HVOLT\_2V6**

Touch sensor high reference voltage, 2.6V

**TOUCH\_HVOLT\_2V7**

Touch sensor high reference voltage, 2.7V

**TOUCH\_HVOLT\_MAX**

**enum touch\_low\_volt\_t**

*Values:*

**TOUCH\_LVOLT\_KEEP = -1**

Touch sensor low reference voltage, no change

**TOUCH\_LVOLT\_0V5 = 0**

Touch sensor low reference voltage, 0.5V

**TOUCH\_LVOLT\_0V6**

Touch sensor low reference voltage, 0.6V

**TOUCH\_LVOLT\_0V7**

Touch sensor low reference voltage, 0.7V

**TOUCH\_LVOLT\_0V8**

Touch sensor low reference voltage, 0.8V

**TOUCH\_LVOLT\_MAX**

**enum touch\_volt\_atten\_t**

*Values:*

**TOUCH\_HVOLT\_ATTEN\_KEEP = -1**

Touch sensor high reference voltage attenuation, no change

**TOUCH\_HVOLT\_ATTEN\_1V5 = 0**

Touch sensor high reference voltage attenuation, 1.5V attenuation

**TOUCH\_HVOLT\_ATTEN\_1V**

Touch sensor high reference voltage attenuation, 1.0V attenuation

**TOUCH\_HVOLT\_ATTEN\_0V5**

Touch sensor high reference voltage attenuation, 0.5V attenuation

**TOUCH\_HVOLT\_ATTEN\_0V**

Touch sensor high reference voltage attenuation, 0V attenuation

**TOUCH\_HVOLT\_ATTEN\_MAX**

**enum touch\_cnt\_slope\_t**

*Values:*

**TOUCH\_PAD\_SLOPE\_0 = 0**

Touch sensor charge / discharge speed, always zero

**TOUCH\_PAD\_SLOPE\_1 = 1**

Touch sensor charge / discharge speed, slowest

**TOUCH\_PAD\_SLOPE\_2 = 2**

Touch sensor charge / discharge speed

**TOUCH\_PAD\_SLOPE\_3 = 3**

Touch sensor charge / discharge speed

**TOUCH\_PAD\_SLOPE\_4 = 4**

Touch sensor charge / discharge speed

**TOUCH\_PAD\_SLOPE\_5 = 5**

Touch sensor charge / discharge speed

**TOUCH\_PAD\_SLOPE\_6** = 6  
Touch sensor charge / discharge speed

**TOUCH\_PAD\_SLOPE\_7** = 7  
Touch sensor charge / discharge speed, fast

**TOUCH\_PAD\_SLOPE\_MAX**

**enum touch\_tie\_opt\_t**

*Values:*

**TOUCH\_PAD\_TIE\_OPT\_LOW** = 0  
Initial level of charging voltage, low level

**TOUCH\_PAD\_TIE\_OPT\_HIGH** = 1  
Initial level of charging voltage, high level

**TOUCH\_PAD\_TIE\_OPT\_MAX**

**enum touch\_fsm\_mode\_t**

*Values:*

**TOUCH\_FSM\_MODE\_TIMER** = 0  
To start touch FSM by timer

**TOUCH\_FSM\_MODE\_SW**  
To start touch FSM by software trigger

**TOUCH\_FSM\_MODE\_MAX**

**enum touch\_trigger\_mode\_t**

*Values:*

**TOUCH\_TRIGGER\_BELOW** = 0  
Touch interrupt will happen if counter value is less than threshold.

**TOUCH\_TRIGGER\_ABOVE** = 1  
Touch interrupt will happen if counter value is larger than threshold.

**TOUCH\_TRIGGER\_MAX**

**enum touch\_trigger\_src\_t**

*Values:*

**TOUCH\_TRIGGER\_SOURCE\_BOTH** = 0  
wakeup interrupt is generated if both SET1 and SET2 are “touched”

**TOUCH\_TRIGGER\_SOURCE\_SET1** = 1  
wakeup interrupt is generated if SET1 is “touched”

**TOUCH\_TRIGGER\_SOURCE\_MAX**

## 2.3.21 UART

### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adapted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2) that feature an identical set of registers for ease of programming and flexibility. Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

## Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the three UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const int uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 3: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins(TX: IO17 (UART2 default), RX: IO16 (UART2 default), RTS: IO18,
↳CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE,
↳18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required ESP32 resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const int uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const int uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in [ESP32 Technical Reference Manual \(PDF\)](#). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in [Driver Installation](#). An example of using Event detection can be found in [peripherals/uart\\_events](#).

- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example [peripherals/uart/uart\\_events](#). It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

### Overview of RS485 specific communication options

---

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. To find more information on a specific option bit, open [Register Summary in the ESP32 Technical Reference Manual](#) (PDF), use the register name to navigate to the register description and then find the field/bit.

---

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section [Interface Connection Options](#)). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32’s UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the `~RE/DE` input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

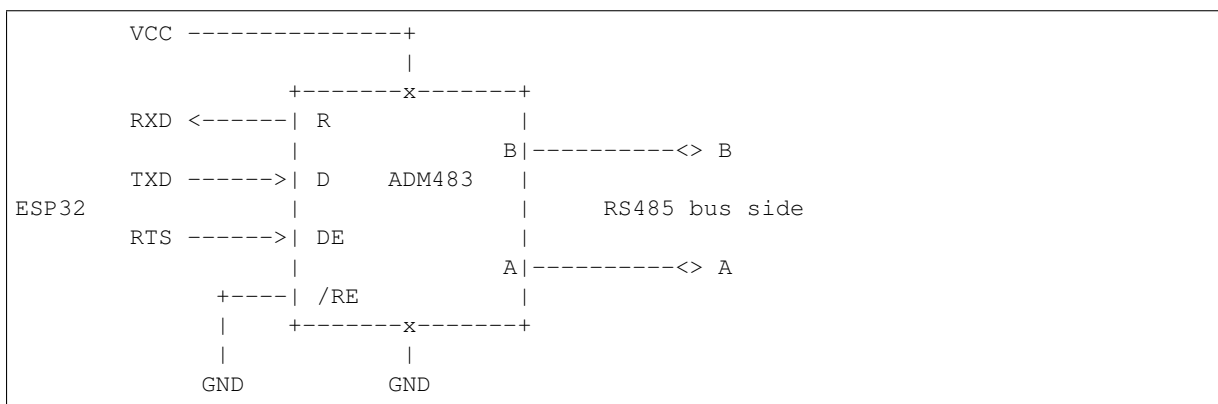

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

**Note:**

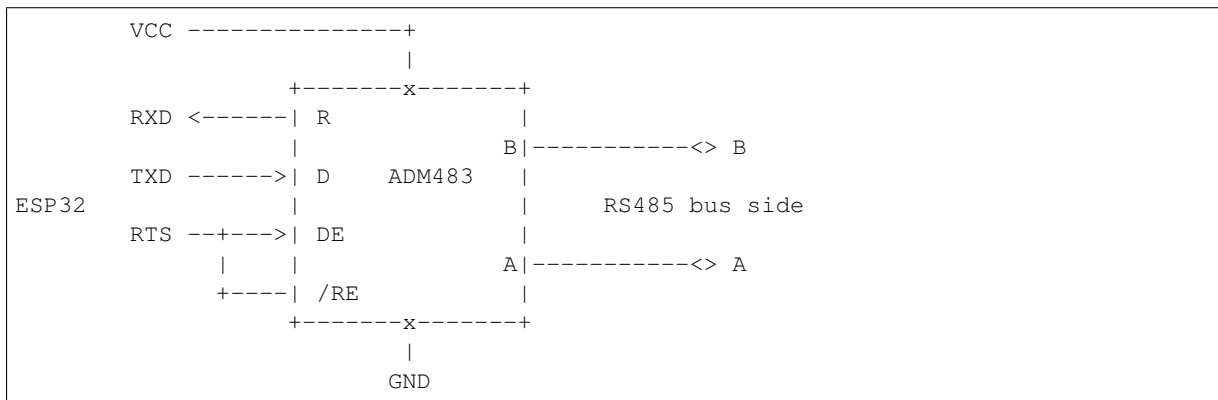

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

**Circuit A: Collision Detection Circuit**

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the ESP32 hardware when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

(continues on next page)

(continued from previous page)

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

## Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- [driver/include/driver/uart.h](#)

### Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** `Rx_buffer_size` should be greater than `UART_FIFO_LEN`. `Tx_buffer_size` should be either zero or greater than `UART_FIFO_LEN`.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* `uart_num`)

Uninstall UART driver.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

bool **uart\_is\_driver\_installed** (*uart\_port\_t* `uart_num`)

Checks whether the driver is installed or not.

**Return**

- true driver is installed
- false driver is not installed

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* `data_bit`)

Set UART data bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: UART data bits

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* \*`data_bit`)

Get the UART data bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: Pointer to accept value of UART data bits.

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* `uart_num`, *uart\_stop\_bits\_t* `stop_bits`)

Set UART stop bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Fail

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits`: UART stop bits

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* *uart\_num*, *uart\_stop\_bits\_t* \**stop\_bits*)

Get the UART stop bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *stop\_bits*: Pointer to accept value of UART stop bits.

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* *uart\_num*, *uart\_parity\_t* *parity\_mode*)

Set UART parity mode.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *parity\_mode*: the enum of uart parity configuration

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* *uart\_num*, *uart\_parity\_t* \**parity\_mode*)

Get the UART parity mode configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *parity\_mode*: Pointer to accept value of UART parity mode.

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* *baudrate*)

Set UART baud rate.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *baudrate*: UART baud rate.

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* \**baudrate*)

Get the UART baud rate configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *baudrate*: Pointer to accept value of UART baud rate

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* *uart\_num*, *uint32\_t* *inverse\_mask*)

Set UART line inverse mode.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *inverse\_mask*: Choose the wires that need to be inverted. Using the ORred mask of *uart\_signal\_inv\_t*

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *uart\_hw\_flowcontrol\_t* *flow\_ctrl*, *uint8\_t* *rx\_thresh*)

Set hardware flow control.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ UART\_FIFO\_LEN). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the `rx_thresh` value be set.

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* `uart_num`, bool `enable`, uint8\_t `rx_thresh_xon`, uint8\_t `rx_thresh_xoff`)

Set software flow control.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* `uart_num`, *uart\_hw\_flowcontrol\_t* `*flow_ctrl`)

Get the UART hardware flow control configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*flow_ctrl`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `flow_ctrl`: Option for different flow control mode.

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* `uart_num`, uint32\_t `clr_mask`)

Clear UART interrupt status.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `clr_mask`: Bit mask of the interrupt status to be cleared.

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* `uart_num`, uint32\_t `enable_mask`)

Set UART interrupt enable.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable_mask`: Bit mask of the enable bits.

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* `uart_num`, uint32\_t `disable_mask`)

Clear UART interrupt enable bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `disable_mask`: Bit mask of the disable bits.

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* `uart_num`)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* *uart\_num*)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* *uart\_num*)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* *uart\_num*, int *enable*, int *thresh*)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable`: 1: enable; 0: disable
- `thresh`: Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

*esp\_err\_t* **uart\_isr\_register** (*uart\_port\_t* *uart\_num*, void (\**fn*)) void \*

, void \**arg*, int *intr\_alloc\_flags*, *uart\_isr\_handle\_t* \**handle* Register UART interrupt handler (ISR).

**Note** UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `fn`: Interrupt handler function.
- `arg`: parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

*esp\_err\_t* **uart\_isr\_free** (*uart\_port\_t* *uart\_num*)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* *uart\_num*, int *tx\_io\_num*, int *rx\_io\_num*, int *rts\_io\_num*, int *cts\_io\_num*)

Set UART pin number.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Note** Instead of GPIO number a macro 'UART\_PIN\_NO\_CHANGE' may be provided to keep the currently allocated pin.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `tx_io_num`: UART TX pin GPIO number.
- `rx_io_num`: UART RX pin GPIO number.
- `rts_io_num`: UART RTS pin GPIO number.
- `cts_io_num`: UART CTS pin GPIO number.

*esp\_err\_t* `uart_set_rts` (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: RTS output low (active); 0: RTS output high (block)

*esp\_err\_t* `uart_set_dtr` (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART DTR pin level.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: DTR output low; 0: DTR output high

*esp\_err\_t* `uart_set_tx_idle_num` (*uart\_port\_t* `uart_num`, uint16\_t `idle_num`)

Set UART idle interval after tx FIFO is empty.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `idle_num`: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

*esp\_err\_t* `uart_param_config` (*uart\_port\_t* `uart_num`, const *uart\_config\_t* \*`uart_config`)

Set UART configuration parameters.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `uart_config`: UART parameter settings

*esp\_err\_t* `uart_intr_config` (*uart\_port\_t* `uart_num`, const *uart\_intr\_config\_t* \*`intr_conf`)

Configure UART interrupts.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

- `intr_conf`: UART interrupt settings

`esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)`

Wait until UART TX FIFO is empty.

**Return**

- `ESP_OK` Success
- `ESP_FAIL` Parameter error
- `ESP_ERR_TIMEOUT` Timeout

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `ticks_to_wait`: Timeout, count in RTOS ticks

int `uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)`

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

**Return**

- (-1) Parameter error
- `OTHERS (>=0)` The number of bytes pushed to the TX FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `buffer`: data buffer address
- `len`: data length to send

int `uart_write_bytes (uart_port_t uart_num, const char *src, size_t size)`

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Return**

- (-1) Parameter error
- `OTHERS (>=0)` The number of bytes pushed to the TX FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `src`: data buffer address
- `size`: data length to send

int `uart_write_bytes_with_break (uart_port_t uart_num, const char *src, size_t size, int brk_len)`

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**

- (-1) Parameter error
- `OTHERS (>=0)` The number of bytes pushed to the TX FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `src`: data buffer address
- `size`: data length to send
- `brk_len`: break signal duration(unit: the time it takes to send one bit at current baudrate)

`int uart_read_bytes (uart_port_t uart_num, uint8_t *buf, uint32_t length, TickType_t ticks_to_wait)`  
UART read bytes from UART buffer.

**Return**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `buf`: pointer to the buffer.
- `length`: data length
- `ticks_to_wait`: sTimeout, count in RTOS ticks

`esp_err_t uart_flush (uart_port_t uart_num)`

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

`esp_err_t uart_flush_input (uart_port_t uart_num)`

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

`esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)`

UART get RX ring buffer cached data length.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `size`: Pointer of `size_t` to accept cached data length

`esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)`

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

`esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)`

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number.

- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as `at_cmd` char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last `at_cmd` char
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first `at_cmd` char.

int `uart_pattern_pop_pos` (*uart\_port\_t* *uart\_num*)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

#### Parameters

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

int `uart_pattern_get_pos` (*uart\_port\_t* *uart\_num*)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

#### Parameters

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* *uart\_num*, int *queue\_length*)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

#### Return

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

#### Parameters

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* *uart\_num*, *uart\_mode\_t* *mode*)

UART set communication mode.

**Note** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `uart_num`: Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `mode`: UART UART mode to set

*esp\_err\_t* **uart\_set\_rx\_full\_threshold** (*uart\_port\_t* *uart\_num*, int *threshold*)

Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

**Parameters**

- `uart_num`: UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `threshold`: Threshold value above which RX fifo full interrupt is generated

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* *uart\_num*, int *threshold*)

Set uart threshold values for TX fifo empty.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

**Parameters**

- `uart_num`: UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* *uart\_num*, const uint8\_t *tout\_thresh*)

UART set threshold timeout for TOUT feature.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

**Parameters**

- `uart_num`: Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* *uart\_num*, bool \**collision\_flag*)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by `collision_flag`. `*collision_flag = true`, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `uart_num`: Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- `collision_flag`: Pointer to variable of type bool to return collision flag.

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* *uart\_num*, int *wakeup\_threshold*)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF\_TICK as UART clock source, by setting `use_ref_tick` field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

#### Parameters

- `uart_num`: UART number, the max port number is (UART\_NUM\_MAX -1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

`esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)`

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `out_wakeup_threshold` is NULL

#### Parameters

- `uart_num`: UART number, the max port number is (UART\_NUM\_MAX -1).
- `[out] out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

`esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)`

Wait until UART tx memory empty and the last char send ok (polling mode).

#### • Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

#### Parameters

- `uart_num`: UART number

`esp_err_t uart_set_loop_back (uart_port_t uart_num, bool loop_back_en)`

Configure TX signal loop back to RX module, just for the test usage.

#### • Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

#### Parameters

- `uart_num`: UART number
- `loop_back_en`: Set true to enable the loop back function, else set it false.

void `uart_set_always_rx_timeout (uart_port_t uart_num, bool always_rx_timeout_en)`

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

#### Parameters

- `uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

### Structures

#### **struct** `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

#### Public Members

##### `uint32_t intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

##### `uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

##### `uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

##### `uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

#### **struct** `uart_event_t`

Event structure used in UART event queue.

#### Public Members

##### `uart_event_type_t type`

UART event type

##### `size_t size`

UART data size for `UART_DATA` event

##### `bool timeout_flag`

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

### Macros

#### `UART_NUM_0`

UART port 0

#### `UART_NUM_1`

UART port 1

#### `UART_NUM_MAX`

UART port max

#### `UART_PIN_NO_CHANGE`

Constant for `uart_set_pin` function which indicates that UART pin should not be changed

### Type Definitions

**typedef** `intr_handle_t` `uart_isr_handle_t`

### Enumerations

#### **enum** `uart_event_type_t`

UART event types used in the ring buffer.

*Values:*

**UART\_DATA**  
UART data event

**UART\_BREAK**  
UART break event

**UART\_BUFFER\_FULL**  
UART RX buffer full event

**UART\_FIFO\_OVF**  
UART FIFO overflow event

**UART\_FRAME\_ERR**  
UART RX frame error event

**UART\_PARITY\_ERR**  
UART RX parity event

**UART\_DATA\_BREAK**  
UART TX data and break event

**UART\_PATTERN\_DET**  
UART pattern detected

**UART\_EVENT\_MAX**  
UART event max index

### Header File

- [soc/include/hal/uart\\_types.h](#)

### Structures

**struct uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

#### Public Members

**uint8\_t cmd\_char**  
UART AT cmd char

**uint8\_t char\_num**  
AT cmd char repeat number

**uint32\_t gap\_tout**  
gap time(in baud-rate) between AT cmd char

**uint32\_t pre\_idle**  
the idle time(in baud-rate) between the non AT char and first AT char

**uint32\_t post\_idle**  
the idle time(in baud-rate) between the last AT char and the none AT char

**struct uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

#### Public Members

**uint8\_t xon\_char**  
Xon flow control char

**uint8\_t xoff\_char**  
Xoff flow control char

`uint8_t xon_thrd`

If the software flow control is enabled and the data amount in rxfifo is less than `xon_thrd`, an `xon_char` will be sent

`uint8_t xoff_thrd`

If the software flow control is enabled and the data amount in rxfifo is more than `xoff_thrd`, an `xoff_char` will be sent

**struct uart\_config\_t**

UART configuration parameters for `uart_param_config` function.

### Public Members

`int baud_rate`

UART baud rate

`uart_word_length_t data_bits`

UART byte size

`uart_parity_t parity`

UART parity mode

`uart_stop_bits_t stop_bits`

UART stop bits

`uart_hw_flowcontrol_t flow_ctrl`

UART HW flow control mode (cts/rts)

`uint8_t rx_flow_ctrl_thresh`

UART HW RTS threshold

`uart_sclk_t source_clk`

UART source clock selection

### Type Definitions

**typedef int uart\_port\_t**

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX -1)`.

### Enumerations

**enum uart\_mode\_t**

UART mode selection.

*Values:*

`UART_MODE_UART = 0x00`

mode: regular UART mode

`UART_MODE_RS485_HALF_DUPLEX = 0x01`

mode: half duplex RS485 UART mode control by RTS pin

`UART_MODE_IRDA = 0x02`

mode: IRDA UART mode

`UART_MODE_RS485_COLLISION_DETECT = 0x03`

mode: RS485 collision detection UART mode (used for test purposes)

`UART_MODE_RS485_APP_CTRL = 0x04`

mode: application control RS485 UART mode (used for test purposes)

**enum uart\_word\_length\_t**

UART word length constants.

*Values:*

**UART\_DATA\_5\_BITS** = 0x0  
word length: 5bits

**UART\_DATA\_6\_BITS** = 0x1  
word length: 6bits

**UART\_DATA\_7\_BITS** = 0x2  
word length: 7bits

**UART\_DATA\_8\_BITS** = 0x3  
word length: 8bits

**UART\_DATA\_BITS\_MAX** = 0x4

**enum uart\_stop\_bits\_t**  
UART stop bits number.

*Values:*

**UART\_STOP\_BITS\_1** = 0x1  
stop bit: 1bit

**UART\_STOP\_BITS\_1\_5** = 0x2  
stop bit: 1.5bits

**UART\_STOP\_BITS\_2** = 0x3  
stop bit: 2bits

**UART\_STOP\_BITS\_MAX** = 0x4

**enum uart\_parity\_t**  
UART parity constants.

*Values:*

**UART\_PARITY\_DISABLE** = 0x0  
Disable UART parity

**UART\_PARITY\_EVEN** = 0x2  
Enable UART even parity

**UART\_PARITY\_ODD** = 0x3  
Enable UART odd parity

**enum uart\_hw\_flowcontrol\_t**  
UART hardware flow control modes.

*Values:*

**UART\_HW\_FLOWCTRL\_DISABLE** = 0x0  
disable hardware flow control

**UART\_HW\_FLOWCTRL\_RTS** = 0x1  
enable RX hardware flow control (rts)

**UART\_HW\_FLOWCTRL\_CTS** = 0x2  
enable TX hardware flow control (cts)

**UART\_HW\_FLOWCTRL\_CTS\_RTS** = 0x3  
enable hardware flow control

**UART\_HW\_FLOWCTRL\_MAX** = 0x4

**enum uart\_signal\_inv\_t**  
UART signal bit map.

*Values:*

**UART\_SIGNAL\_INV\_DISABLE** = 0  
Disable UART signal inverse

**UART\_SIGNAL\_IRDA\_TX\_INV** = (0x1 << 0)  
inverse the UART irda\_tx signal

**UART\_SIGNAL\_IRDA\_RX\_INV** = (0x1 << 1)  
inverse the UART irda\_rx signal

**UART\_SIGNAL\_RXD\_INV** = (0x1 << 2)  
inverse the UART rxd signal

**UART\_SIGNAL\_CTS\_INV** = (0x1 << 3)  
inverse the UART cts signal

**UART\_SIGNAL\_DSR\_INV** = (0x1 << 4)  
inverse the UART dsr signal

**UART\_SIGNAL\_TXD\_INV** = (0x1 << 5)  
inverse the UART txd signal

**UART\_SIGNAL\_RTS\_INV** = (0x1 << 6)  
inverse the UART rts signal

**UART\_SIGNAL\_DTR\_INV** = (0x1 << 7)  
inverse the UART dtr signal

**enum uart\_sclk\_t**  
UART source clock.

*Values:*

**UART\_SCLK\_APB** = 0x0  
UART source clock from APB

**UART\_SCLK\_REF\_TICK** = 0x01  
UART source clock from REF\_TICK

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. [UART\\_NUM\\_2\\_TXD\\_DIRECT\\_GPIO\\_NUM](#) returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. [UART\\_GPIO19\\_DIRECT\\_CHANNEL](#) returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is UART\_NUM\_0)
3. [UART\\_CTS\\_GPIO19\\_DIRECT\\_CHANNEL](#) returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is UART\_NUM\_0). Similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

UART\_CTS\_GPIO8\_DIRECT\_CHANNEL  
UART\_RTS\_GPIO7\_DIRECT\_CHANNEL

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.4 Application Protocols

### 2.4.1 ASIO port

#### Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be found under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port and ssl. Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

#### Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp\\_echo\\_server](#)
- [protocols/asio/tcp\\_echo\\_server](#)
- [protocols/asio/chat\\_client](#)
- [protocols/asio/chat\\_server](#)

Please refer to the specific example README.md for details

### 2.4.2 ESP-MQTT

#### Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

#### Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

#### Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

## Configuration

### URI

- Currently support `mqtt`, `mqtt`s, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipse.org`: MQTT over TCP, default port 1883:
  - `mqtt://mqtt.eclipse.org:1884` MQTT over TCP, port 1884:
  - `mqtt://username:password@mqtt.eclipse.org:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtt`s://mqtt.eclipse.org: MQTT over SSL, port 8883
  - `mqtt`s://mqtt.eclipse.org:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - `ws://mqtt.eclipse.org:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipse.org:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipse.org",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

### SSL

- Get certificate from server, example: `mqtt.eclipse.org openssl s_client -showcerts -connect mqtt.eclipse.org:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipse.org:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in `esp-tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

### Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

### Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.

- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)`

Creates mqtt client handle based on the configuration.

**Return** `mqtt_client_handle` if successfully created, `NULL` on error

#### Parameters

- `config`: mqtt configuration structure

`esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)`

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Return** `ESP_FAIL` if URI parse error, `ESP_OK` on success

#### Parameters

- `client`: mqtt client handle
- `uri`:

`esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)`

Starts mqtt client with already created client handle.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` on other error

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force reconnection upon a specific event.

**Return** `ESP_OK` on success `ESP_FAIL` if client is in invalid state

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force disconnection from the broker.

**Return** `ESP_OK` on success

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)`

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

**Return** `ESP_OK` on success `ESP_FAIL` if client is in invalid state

#### Parameters

- `client`: mqtt client handle

int **esp\_mqtt\_client\_subscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)  
Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress).

**Return** message\_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
- `topic`:
- `qos`:

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)  
Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message\_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
- `topic`:

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)  
Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure.

**Parameters**

- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

**Return** message\_id if queued successfully, -1 otherwise

**Parameters**

- `client`: mqtt client handle

- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag
- `store`: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

`esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)`

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

**Return** ESP\_OK

**Parameters**

- `client`: mqtt client handle

`esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event.

**Return** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_OK on success

**Parameters**

- `client`: mqtt client handle
- `config`: mqtt configuration structure

`esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`

Registers mqtt event.

**Return** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_OK on success

**Parameters**

- `client`: mqtt client handle
- `event`: event type
- `event_handler`: handler callback
- `event_handler_arg`: handlers context

`int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)`

Get outbox size.

**Return** outbox size

**Parameters**

- `client`: mqtt client handle

## Structures

**struct esp\_mqtt\_error\_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

### Public Members

*esp\_err\_t* **esp\_tls\_last\_esp\_err**

last esp\_err code reported from esp-tls component

int **esp\_tls\_stack\_err**

tls specific error code reported from underlying tls stack

int **esp\_tls\_cert\_verify\_flags**

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

**struct esp\_mqtt\_event\_t**

MQTT event configuration structure

### Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

MQTT event type

*esp\_mqtt\_client\_handle\_t* **client**

MQTT client handle for this event

void **\*user\_context**

User context passed from MQTT client config

char **\*data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char **\*topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

MQTT messaged id of message

int **session\_present**

MQTT session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* **\*error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

**struct esp\_mqtt\_client\_config\_t**

MQTT client configuration structure

## Public Members

*mqtt\_event\_callback\_t* **event\_handle**

handle for MQTT events as a callback in legacy mode

*esp\_event\_loop\_handle\_t* **event\_loop\_handle**

handle for MQTT event loop library

**const char \*host**

MQTT server domain (ipv4 as string)

**const char \*uri**

Complete MQTT broker URI

**uint32\_t port**

MQTT server port

**const char \*client\_id**

default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

**const char \*username**

MQTT username

**const char \*password**

MQTT password

**const char \*lwt\_topic**

LWT (Last Will and Testament) message topic (NULL by default)

**const char \*lwt\_msg**

LWT message (NULL by default)

**int lwt\_qos**

LWT message qos

**int lwt\_retain**

LWT retained message flag

**int lwt\_msg\_len**

LWT message length

**int disable\_clean\_session**

mqtt clean session, default clean\_session is true

**int keepalive**

mqtt keepalive, default is 120 seconds

**bool disable\_auto\_reconnect**

this mqtt client will reconnect to server (when errors/disconnect). Set disable\_auto\_reconnect=true to disable

**void \*user\_context**

pass user context to this option, then can receive that context in event->user\_context

**int task\_prio**

MQTT task priority, default is 5, can be changed in make menuconfig

**int task\_stack**

MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

**int buffer\_size**

size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out\_buffer\_size defined)

**const char \*cert\_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert\_len.

**size\_t cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

**const char \*client\_cert\_pem**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

**size\_t client\_cert\_len**

Length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem

**const char \*client\_key\_pem**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

**size\_t client\_key\_len**

Length of the buffer pointed to by client\_key\_pem. May be 0 for null-terminated pem

***esp\_mqtt\_transport\_t* transport**

overrides URI transport

**int refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

**const struct *psk\_key\_hint* \*psk\_hint\_key**

Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

**bool use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

**int reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

**const char \*\*alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN

**const char \*clientkey\_password**

Client key decryption password string

**int clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

***esp\_mqtt\_protocol\_ver\_t* protocol\_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

**int out\_buffer\_size**

size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

**bool skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

**bool use\_secure\_element**

enable secure element for enabling SSL connection

**void \*ds\_data**

carrier of handle for digital signature parameters

**int network\_timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

**bool disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by

default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

## Macros

### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

## Type Definitions

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
```

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

<code>error_type</code>	related member variables	note	<code>MQTT_ERROR_TYPE_TCP_TRANSPORT</code>
<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from <code>tcp_transport/esp-tls</code>	<code>MQTT_ERROR_TYPE_CONNECTION_REFUSED</code>	<code>connect_return_code</code>   Internal error reported from MQTT broker on connection

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

## Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

Values:

```
MQTT_EVENT_ANY = -1
```

```
MQTT_EVENT_ERROR = 0
```

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

```
MQTT_EVENT_CONNECTED
```

connected event, additional context: `session_present` flag

```
MQTT_EVENT_DISCONNECTED
```

disconnected event

```
MQTT_EVENT_SUBSCRIBED
```

subscribed event, additional context: `msg_id`

```
MQTT_EVENT_UNSUBSCRIBED
```

unsubscribed event

```
MQTT_EVENT_PUBLISHED
```

published event, additional context: `msg_id`

```
MQTT_EVENT_DATA
```

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

**MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

**enum esp\_mqtt\_connect\_return\_code\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_CONNECTION\_ACCEPTED = 0**

Connection accepted

**MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

MQTT connection refused reason: Wrong protocol

**MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

MQTT connection refused reason: ID rejected

**MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

**MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

MQTT connection refused reason: Wrong user

**MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

**enum esp\_mqtt\_error\_type\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_ERROR\_TYPE\_NONE = 0****MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT****MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED****enum esp\_mqtt\_transport\_t**

*Values:*

**MQTT\_TRANSPORT\_UNKNOWN = 0x0****MQTT\_TRANSPORT\_OVER\_TCP**

MQTT over TCP, using scheme: `mqtt`

**MQTT\_TRANSPORT\_OVER\_SSL**

MQTT over SSL, using scheme: `mqttssl`

**MQTT\_TRANSPORT\_OVER\_WS**

MQTT over Websocket, using scheme: `ws`

**MQTT\_TRANSPORT\_OVER\_WSS**MQTT over Websocket Secure, using scheme: `wss`**enum esp\_mqtt\_protocol\_ver\_t**

MQTT protocol version used for connection

*Values:***MQTT\_PROTOCOL\_UNDEFINED** = 0**MQTT\_PROTOCOL\_V\_3\_1****MQTT\_PROTOCOL\_V\_3\_1\_1**

## 2.4.3 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use `mbedtls` or `wolfssl` as their underlying SSL/TLS library. By default only `mbedtls` is available and is used, `wolfssl` SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides `wolfssl` component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository `README.md` for information on licensing and other options. Please see below option for using `wolfssl` in your project.

**Note:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

---

**Note:** *These values are subject to change with change in configuration options and version of respective libraries.*

---

## API Reference

### Header File

- [esp-tls/esp\\_tls.h](#)

### Functions

`esp_tls_t *esp_tls_init` (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Return** tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t*\***esp\_tls\_conn\_new**(**const** char \*hostname, int hostlen, int port, **const** *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_new\_async*)

**Return** pointer to *esp\_tls\_t*, or NULL if connection couldn't be opened.

#### Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.

int **esp\_tls\_conn\_new\_sync**(**const** char \*hostname, int hostlen, int port, **const** *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### Return

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

#### Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- [in] tls: Pointer to esp-tls as esp-tls handle.

*esp\_tls\_t*\***esp\_tls\_conn\_http\_new**(**const** char \*url, **const** *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as *esp\_tls\_conn\_new*() API. However this API accepts host's url.

**Return** pointer to *esp\_tls\_t*, or NULL if connection couldn't be opened.

#### Parameters

- [in] url: url of host.
- [in] cfg: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to '*esp\_tls\_cfg\_t*'. At a minimum, this structure should be zero-initialized.

int **esp\_tls\_conn\_new\_async**(**const** char \*hostname, int hostlen, int port, **const** *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

#### Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

#### Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.

- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

int **esp\_tls\_conn\_http\_new\_async** (const char \**url*, const *esp\_tls\_cfg\_t* \**cfg*, *esp\_tls\_t* \**tls*)  
Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

#### Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

#### Parameters

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

static ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \**tls*, const void \**data*, size\_t *datalen*)  
Write from buffer ‘data’ into specified tls connection.

#### Return

- >0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- 0 if write operation was not successful. The underlying connection was closed.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

#### Parameters

- [in] *tls*: pointer to esp-tls as esp-tls handle.
- [in] *data*: Buffer from which data will be written.
- [in] *datalen*: Length of data buffer.

static ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \**tls*, void \**data*, size\_t *datalen*)  
Read from specified tls connection into the buffer ‘data’ .

#### Return

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

#### Parameters

- [in] *tls*: pointer to esp-tls as esp-tls handle.
- [in] *data*: Buffer to hold read data.
- [in] *datalen*: Length of data buffer.

void **esp\_tls\_conn\_delete** (*esp\_tls\_t* \**tls*)  
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

#### Parameters

- [in] *tls*: pointer to esp-tls as esp-tls handle.

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \**tls*)  
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s `mbedtls_ssl_get_bytes_avail()` API.

#### Return

- -1 in case of invalid arg

- bytes available in the application data record read buffer

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Return**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store** (const unsigned char \**cacert\_pem\_buf*, const unsigned int *cacert\_pem\_bytes*)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Return**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `cacert_pem_buf`: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- [in] `cacert_pem_bytes`: Length of the buffer.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* *h*, int \**esp\_tls\_code*, int \**esp\_tls\_flags*)

Returns last error in *esp\_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred
- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

**Parameters**

- [in] `h`: esp-tls error handle.
- [out] `esp_tls_code`: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- [out] `esp_tls_flags`: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

**Structures**

**struct esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

**Public Members**

*esp\_err\_t* **last\_error**

error code (based on ESP\_ERR\_ESP\_TLS\_BASE) of the last occurred error

**int esp\_tls\_error\_code**  
*esp\_tls* error code from last *esp\_tls* failed api

**int esp\_tls\_flags**  
last certification verification flags

**struct psk\_key\_hint**  
ESP-TLS preshared key and hint structure.

### Public Members

**const uint8\_t \*key**  
key in PSK authentication mode in binary format

**const size\_t key\_size**  
length of the key

**const char \*hint**  
hint in PSK authentication mode in string format

**struct tls\_keep\_alive\_cfg**  
Keep alive parameters structure.

### Public Members

**bool keep\_alive\_enable**  
Enable keep-alive timeout

**int keep\_alive\_idle**  
Keep-alive idle time (second)

**int keep\_alive\_interval**  
Keep-alive interval time (second)

**int keep\_alive\_count**  
Keep-alive packet retry send count

**struct esp\_tls\_cfg**  
ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

### Public Members

**const char \*\*alpn\_protos**  
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: `const char **alpn_protos = { "h2", NULL };`

- where 'h2' is the protocol name

**const unsigned char \*cacert\_buf**  
Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

**const** unsigned char \***cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

**const** unsigned char \***clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

**const** unsigned char \***clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

**const** unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

**const** unsigned char \***clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

**const** unsigned char \***clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

int **timeout\_ms**

Network timeout in milliseconds

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

**const** char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

**const** *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

**struct esp\_tls**

ESP-TLS Connection Handle.

**Public Members**int **sockfd**

Underlying socket file descriptor.

ssize\_t (\***read**) (**struct esp\_tls** \*tls, char \*data, size\_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize\_t (\***write**) (**struct esp\_tls** \*tls, const char \*data, size\_t datalen)

Callback function for writing data to TLS/SSL connection.

*esp\_tls\_conn\_state\_t* **conn\_state**

ESP-TLS Connection state

fd\_set **rset**

read file descriptors

fd\_set **wset**

write file descriptors

bool **is\_tls**

indicates connection type (TLS or NON-TLS)

*esp\_tls\_role\_t* **role**

esp-tls role

- ESP\_TLS\_CLIENT
- ESP\_TLS\_SERVER

*esp\_tls\_error\_handle\_t* **error\_handle**

handle to error descriptor

**Macros****ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

**ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

**ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

**ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

**ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

**ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set socket option

**ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

**ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

**Type Definitions****typedef struct esp\_tls\_last\_error \*esp\_tls\_error\_handle\_t****typedef struct esp\_tls\_last\_error esp\_tls\_last\_error\_t**

Error structure containing relevant errors in case tls error occurred.

**typedef enum esp\_tls\_conn\_state esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

**typedef enum esp\_tls\_role esp\_tls\_role\_t****typedef struct psk\_key\_hint psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

**typedef struct tls\_keep\_alive\_cfg tls\_keep\_alive\_cfg\_t**

Keep alive parameters structure.

**typedef struct esp\_tls\_cfg esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

**typedef struct esp\_tls esp\_tls\_t**

ESP-TLS Connection Handle.

**Enumerations****enum esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

```

ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE
enum esp_tls_role
Values:
ESP_TLS_CLIENT = 0
ESP_TLS_SERVER

```

## 2.4.4 ESP HTTP Client

### Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event\_handle (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it's done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`'s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

### Application Example

```

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");

```

(continues on next page)

(continued from previous page)

```

        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

### Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

### Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);

```

### HTTPS

The HTTP client supports SSL connections using `mbedtls`, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via `:ref:CONFIG_ENABLE_HTTPS` (enabled by default)..

**Note:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem`

in `esp_http_client_config_t`

---

### HTTPS example

```
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

### HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always to be called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

**Perform HTTP request as Stream reader** Check the example function `http_perform_as_stream_reader` at [protocols/esp\\_http\\_client](#).

### HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of config entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

### Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

### Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp\\_http\\_client](#).

## API Reference

### Header File

### Functions

*esp\_http\_client\_handle\_t* **esp\_http\_client\_init** (**const** *esp\_http\_client\_config\_t* \*config)

Start a HTTP session This function must be the first function to call, and it returns a *esp\_http\_client\_handle\_t* that you must use as input to other functions in the interface. This call MUST have a corresponding call to *esp\_http\_client\_cleanup* when the operation is complete.

#### Return

- *esp\_http\_client\_handle\_t*
- NULL if any errors

#### Parameters

- [in] config: The configurations, see *http\_client\_config\_t*

*esp\_err\_t* **esp\_http\_client\_perform** (*esp\_http\_client\_handle\_t* client)

Invoke this function after *esp\_http\_client\_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp\_http\_client\_handle\_t* as input as the *esp\_http\_client\_init* call returned. *esp\_http\_client\_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp\_http\_client\_perform()*, *is\_async* member of *esp\_http\_client\_config\_t* must be set while making a call to *esp\_http\_client\_init()* API. You can do any amount of calls to *esp\_http\_client\_perform* while using the same *esp\_http\_client\_handle\_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp\_http\_client* will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp\_http\_client\_set\_\** between the invokes to set options for the following *esp\_http\_client\_perform*.

**Note** You must never call this function simultaneously from two places using the same client handle.

Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp\_http\_client\_handle\_t*. This function include *esp\_http\_client\_open* -> *esp\_http\_client\_write* -> *esp\_http\_client\_fetch\_headers* -> *esp\_http\_client\_read* (and option) *esp\_http\_client\_close*.

#### Return

- ESP\_OK on successful
- ESP\_FAIL on error

**Parameters**

- `client`: The `esp_http_client` handle

*esp\_err\_t* `esp_http_client_set_url` (*esp\_http\_client\_handle\_t* `client`, **const** char \*`url`)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**

- `ESP_OK`
- `ESP_FAIL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `url`: The url

*esp\_err\_t* `esp_http_client_set_post_field` (*esp\_http\_client\_handle\_t* `client`, **const** char \*`data`,  
int `len`)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**

- `ESP_OK`
- `ESP_FAIL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `data`: post data pointer
- [in] `len`: post length

int `esp_http_client_get_post_field` (*esp\_http\_client\_handle\_t* `client`, char \*\*`data`)

Get current post field information.

**Return** Size of post data

**Parameters**

- [in] `client`: The client
- [out] `data`: Point to post data pointer

*esp\_err\_t* `esp_http_client_set_header` (*esp\_http\_client\_handle\_t* `client`, **const** char \*`key`, **const**  
char \*`value`)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Return**

- `ESP_OK`
- `ESP_FAIL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [in] `value`: The header value

*esp\_err\_t* `esp_http_client_get_header` (*esp\_http\_client\_handle\_t* `client`, **const** char \*`key`, char  
\*\*`value`)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- `ESP_OK`
- `ESP_FAIL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [out] `value`: The header value

*esp\_err\_t* `esp_http_client_get_username` (*esp\_http\_client\_handle\_t* `client`, char \*\*`value`)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The username value

`esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)`

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `username`: The username value

`esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)`

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The password value

`esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, char *password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `password`: The password value

`esp_err_t esp_http_client_set_auth_type(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)`

Set http request auth\_type.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `auth_type`: The `esp_http_client` auth type

`esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)`

Set http request method.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `method`: The method

`esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)`

Delete http request header.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The `esp_http_client` handle
- [in] *key*: The key

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* *client*, int *write\_len*)

This function will be open the connection, write all header strings and return.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The `esp_http_client` handle
- [in] *write\_len*: HTTP Content length need to write to the server

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* *client*, const char \**buffer*, int *len*)

This function will write data to the HTTP connection previously opened by `esp_http_client_open()`

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: This value must not be larger than the *write\_len* parameter provided to `esp_http_client_open()`

int **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* *client*)

This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked` response)
- (-1: ESP\_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- [in] *client*: The `esp_http_client` handle

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t* *client*)

Check response data is chunked.

**Return** true or false

**Parameters**

- [in] *client*: The `esp_http_client` handle

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t* *client*, char \**buffer*, int *len*)

Read data from http stream.

**Return**

- (-1) if any errors
- Length of data was read

**Parameters**

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: The length

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t* *client*)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Return** Status code

**Parameters**

- [in] *client*: The `esp_http_client` handle

int **esp\_http\_client\_get\_content\_length** (*esp\_http\_client\_handle\_t client*)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Return**

- (-1) Chunked transfer
- Content-Length value as bytes

**Parameters**

- [in] `client`: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_close** (*esp\_http\_client\_handle\_t client*)

Close http connection, still kept all http request resources.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `client`: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_cleanup** (*esp\_http\_client\_handle\_t client*)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `client`: The `esp_http_client` handle

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t client*)

Get transport type.

**Return**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

**Parameters**

- [in] `client`: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t client*)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `client`: The `esp_http_client` handle

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t client*)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

- [in] `client`: The `esp_http_client` handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t client*)

Checks if entire data in the response has been read without any error.

**Return**

- true
- false

**Parameters**

- [in] `client`: The `esp_http_client` handle

**Structures****struct esp\_http\_client\_event**

HTTP Client events data.

**Public Members***esp\_http\_client\_event\_id\_t* **event\_id**  
event\_id, to know the cause of the event*esp\_http\_client\_handle\_t* **client**  
esp\_http\_client\_handle\_t contextvoid **\*data**  
data of the eventint **data\_len**  
data length of datavoid **\*user\_data**  
user\_data context, from *esp\_http\_client\_config\_t* user\_datachar **\*header\_key**  
For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header keychar **\*header\_value**  
For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header value**struct esp\_http\_client\_config\_t**

HTTP configuration.

**Public Members****const** char **\*url**  
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any**const** char **\*host**  
Domain or IP as stringint **port**  
Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)**const** char **\*username**  
Using for Http authentication**const** char **\*password**  
Using for Http authentication*esp\_http\_client\_auth\_type\_t* **auth\_type**  
Http authentication type, see esp\_http\_client\_auth\_type\_t**const** char **\*path**  
HTTP Path, if not set, default is /**const** char **\*query**  
HTTP query**const** char **\*cert\_pem**  
SSL server certification, PEM format as string, if the client requires to verify server

**const char \*client\_cert\_pem**  
SSL client certification, PEM format as string, if the server requires to verify client

**const char \*client\_key\_pem**  
SSL client key, PEM format as string, if the server requires to verify client

**const char \*user\_agent**  
The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**  
HTTP Method

**int timeout\_ms**  
Network timeout in milliseconds

**bool disable\_auto\_redirect**  
Disable HTTP automatic redirects

**int max\_redirection\_count**  
Max redirection number, using default value if zero

*http\_event\_handle\_cb* **event\_handler**  
HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**  
HTTP transport type, see *esp\_http\_client\_t* transport\_t

**int buffer\_size**  
HTTP receive buffer size

**int buffer\_size\_tx**  
HTTP transmit buffer size

**void \*user\_data**  
HTTP user\_data context

**bool is\_async**  
Set asynchronous mode, only supported with HTTPS for now

**bool use\_global\_ca\_store**  
Use a global ca\_store for all the connections in which this bool is set.

**bool skip\_cert\_common\_name\_check**  
Skip any validation of server certificate CN field

**bool keep\_alive\_enable**  
Enable keep-alive timeout

**int keep\_alive\_idle**  
Keep-alive idle time. Default is 5 (second)

**int keep\_alive\_interval**  
Keep-alive interval time. Default is 5 (second)

**int keep\_alive\_count**  
Keep-alive packet retry send count. Default is 3 counts

### Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**  
Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**  
The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**  
Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**Type Definitions****typedef struct** esp\_http\_client \***esp\_http\_client\_handle\_t****typedef struct** esp\_http\_client\_event \***esp\_http\_client\_event\_handle\_t****typedef struct** esp\_http\_client\_event **esp\_http\_client\_event\_t**

HTTP Client events data.

**typedef** esp\_err\_t (\***http\_event\_handle\_cb**)(esp\_http\_client\_event\_t \*evt)**Enumerations****enum** esp\_http\_client\_event\_id\_t

HTTP Client events id.

*Values:***HTTP\_EVENT\_ERROR = 0**

This event occurs when there are any errors during execution

**HTTP\_EVENT\_ON\_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

**HTTP\_EVENT\_HEADERS\_SENT**

After sending all the headers to the server

**HTTP\_EVENT\_HEADER\_SENT = HTTP\_EVENT\_HEADERS\_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

**HTTP\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the server

**HTTP\_EVENT\_ON\_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

**HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

**HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

**enum** esp\_http\_client\_transport\_t

HTTP Client transport.

*Values:***HTTP\_TRANSPORT\_UNKNOWN = 0x0**

Unknown

**HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

**HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

**enum esp\_http\_client\_method\_t**

HTTP method.

*Values:*

**HTTP\_METHOD\_GET = 0**

HTTP GET Method

**HTTP\_METHOD\_POST**

HTTP POST Method

**HTTP\_METHOD\_PUT**

HTTP PUT Method

**HTTP\_METHOD\_PATCH**

HTTP PATCH Method

**HTTP\_METHOD\_DELETE**

HTTP DELETE Method

**HTTP\_METHOD\_HEAD**

HTTP HEAD Method

**HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

**HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

**HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

**HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

**HTTP\_METHOD\_MAX**

**enum esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

**HTTP\_AUTH\_TYPE\_NONE = 0**

No authentication

**HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

**HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

**enum HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

**HttpStatus\_Ok = 200**

**HttpStatus\_MultipleChoices = 300**

**HttpStatus\_MovedPermanently = 301**

**HttpStatus\_Found = 302**

**HttpStatus\_TemporaryRedirect = 307**

**HttpStatus\_Unauthorized = 401**

## 2.4.5 HTTP Server

### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including uri name, method type (eg. HTTPD\_GET/HTTPD\_POST/HTTPD\_PUT etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

### Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char[100] content;

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }
}

```

(continues on next page)

```
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
}
```

**Simple HTTP server example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

## Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↪data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↪context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

## API Reference

### Header File

- [esp\\_http\\_server/include/esp\\_http\\_server.h](#)

### Functions

**esp\_err\_t httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, **const** *httpd\_uri\_t* \*uri\_handler)  
Registers a URI handler.

Example usage:

```

esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {

```

(continues on next page)

```

        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

```

**Note** URI handlers can be registered in real time as long as the server handle is valid.

#### Return

- ESP\_OK : On successfully registering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_HANDLERS\_FULL : If no slots left for new handler
- ESP\_ERR\_HTTPD\_HANDLER\_EXISTS : If handler with same URI and method is already registered

#### Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri\_handler: pointer to handler that needs to be registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, **const** char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

#### Return

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

#### Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, **const** char \*uri)

Unregister all URI handlers with the specified uri string.

#### Return

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

#### Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri: uri string specifying all handlers that need to be deregistered

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request

packets.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- `[in]` `hd`: HTTPD instance handle
- `[in]` `sockfd`: Session socket FD
- `[in]` `recv_func`: The receive function to be set for this session

`esp_err_t httpd_sess_set_send_override` (`httpd_handle_t` `hd`, `int` `sockfd`, `httpd_send_func_t` `send_func`)

Override web server' s send function (by session FD)

This function overrides the web server' s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- `[in]` `hd`: HTTPD instance handle
- `[in]` `sockfd`: Session socket FD
- `[in]` `send_func`: The send function to be set for this session

`esp_err_t httpd_sess_set_pending_override` (`httpd_handle_t` `hd`, `int` `sockfd`, `httpd_pending_func_t` `pending_func`)

Override web server' s pending function (by session FD)

This function overrides the web server' s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- `[in]` `hd`: HTTPD instance handle
- `[in]` `sockfd`: Session socket FD
- `[in]` `pending_func`: The receive function to be set for this session

`int httpd_req_to_sockfd` (`httpd_req_t` \*`r`)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Return**

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**

- `[in]` `r`: The request whose socket descriptor should be found

`int httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)`

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘`buf_len`’ number of bytes, while the pointer to content data is incremented internally by the same number.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

#### Return

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling `socket recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling `socket recv()`

#### Parameters

- [in] `r`: The request being responded to
- [in] `buf`: Pointer to a buffer that the data will be read into
- [in] `buf_len`: Length of the buffer

`size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char *field)`

Search for a field in request headers and return the string length of it’ s value.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

#### Return

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

#### Parameters

- [in] `r`: The request being responded to
- [in] `field`: The header field to be searched in the request

`esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)`

Get the value string of a field from the request headers.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length

#### Return

- `ESP_OK` : Field found in the request header and value string copied
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

#### Parameters

- [in] `r`: The request being responded to
- [in] `field`: The field to be searched in the header

- [out] val: Pointer to the buffer into which the value will be copied if the field is found
- [in] val\_size: Size of the user buffer “val”

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

**Note** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

**Return**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

**Parameters**

- [in] r: The request being responded to

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

**Note**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using *httpd\_req\_get\_hdr\_value\_str*() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use *httpd\_req\_get\_url\_query\_len*() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**

- ESP\_OK : Query is found in the request URL and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Query not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Query string truncated

**Parameters**

- [in] r: The request being responded to
- [out] buf: Pointer to the buffer into which the query string will be copied (if found)
- [in] buf\_len: Length of output buffer

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**Note**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val\_size, then the value is truncated, accompanied by truncation error as return value.

**Return**

- ESP\_OK : Key is found in the URL query string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

**Parameters**

- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val\_size: Size of the user buffer “val”

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “\*” anywhere else in the template will be taken literally.

**Return** true if a match was found

**Parameters**

- [in] uri\_template: URI template (pattern)
- [in] uri\_to\_match: URI to be matched
- [in] match\_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf\_len: Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use `strlen()`

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `buf`: Pointer to a buffer that stores the data
- `[in]` `buf_len`: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

**static** `esp_err_t httpd_resp_sendstr` (`httpd_req_t *r`, **const** `char *str`)

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `str`: String to be sent as response body

**static** `esp_err_t httpd_resp_sendstr_chunk` (`httpd_req_t *r`, **const** `char *str`)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `str`: String to be sent as response body (NULL to finish response packet)

`esp_err_t httpd_resp_set_status` (`httpd_req_t *r`, **const** `char *status`)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the status to this value. The status isn’ t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments

- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `status`: The HTTP status code of this response

*esp\_err\_t* `httpd_resp_set_type` (*httpd\_req\_t* \**r*, **const** char \**type*)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `type`: The Content Type of the response

*esp\_err\_t* `httpd_resp_set_hdr` (*httpd\_req\_t* \**r*, **const** char \**field*, **const** char \**value*)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `field`: The field name of the HTTP header
- `[in]` `value`: The value of this HTTP header

*esp\_err\_t* `httpd_resp_send_err` (*httpd\_req\_t* \**req*, *httpd\_err\_code\_t* *error*, **const** char \**msg*)

For sending out error code in response to HTTP request.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

**static** *esp\_err\_t* **httpd\_resp\_send\_404** (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to

**static** *esp\_err\_t* **httpd\_resp\_send\_408** (*httpd\_req\_t* \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to

**static** *esp\_err\_t* **httpd\_resp\_send\_500** (*httpd\_req\_t* \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to

int **httpd\_send** (*httpd\_req\_t* \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`

#### Return

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

#### Parameters

- [in] `r`: The request being responded to
- [in] `buf`: Buffer from where the fully constructed packet is to be read
- [in] `buf_len`: Length of the buffer

```
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error,
                                     httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

#### Return

- `ESP_OK` : handler registered successfully
- `ESP_ERR_INVALID_ARG` : invalid error code or server handle

#### Parameters

- [in] `handle`: HTTP server handle
- [in] `error`: Error type
- [in] `handler_fn`: User implemented handler function (Pass NULL to unset any previously set handler)

```
esp_err_t httpd_start(httpd_handle_t*handle, const httpd_config_t*config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
}
```

(continues on next page)

```

return server;
}

```

**Return**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)
- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

**Parameters**

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```

// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

```

**Return**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

**Parameters**

- [in] handle: Handle to server returned by httpd\_start

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

**Note** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**Return**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] handle: Handle to server returned by httpd\_start
- [in] work: Pointer to the function to be executed in the HTTPD's context
- [in] arg: Pointer to the arguments that should be passed to this function

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd\_req\_t structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Return**

- void\* : Pointer to the context associated with this session

- NULL : Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.

void `httpd_sess_set_ctx` (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)  
Set session context by socket descriptor.

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free\_fn: Function that should be called to free the context

void \*`httpd_sess_get_transport_ctx` (*httpd\_handle\_t* handle, int sockfd)  
Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

**Return**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.

void `httpd_sess_set_transport_ctx` (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)  
Set session 'transport' context by socket descriptor.

See `httpd_sess_set_ctx()`

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Transport context object to assign to the session
- [in] free\_fn: Function that should be called to free the transport context

void \*`httpd_get_global_user_ctx` (*httpd\_handle\_t* handle)  
Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

void \*`httpd_get_global_transport_ctx` (*httpd\_handle\_t* handle)  
Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

*esp\_err\_t* `httpd_sess_trigger_close` (*httpd\_handle\_t* handle, int sockfd)  
Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**

- ESP\_OK : On successfully initiating closure
- ESP\_FAIL : Failure to queue work
- ESP\_ERR\_NOT\_FOUND : Socket fd not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

- [in] `sockfd`: The socket descriptor of the session to be closed

`esp_err_t httpd_sess_update_lru_counter` (`httpd_handle_t handle`, `int sockfd`)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- [in] `handle`: Handle to server returned by `httpd_start`
- [in] `sockfd`: The socket descriptor of the session for which LRU counter is to be updated

## Structures

### `struct httpd_config`

HTTP Server Configuration Structure.

**Note** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

## Public Members

unsigned `task_priority`

Priority of FreeRTOS task which runs the server

size\_t `stack_size`

The maximum stack size allowed for the server task

BaseType\_t `core_id`

The core the HTTP server task will run on

uint16\_t `server_port`

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t `ctrl_port`

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t `max_open_sockets`

Max number of sockets/clients connected at any time

uint16\_t `max_uri_handlers`

Maximum allowed uri handlers

uint16\_t `max_resp_headers`

Maximum allowed additional headers in HTTP response

uint16\_t `backlog_conn`

Number of backlog connections

bool `lru_purge_enable`

Purge “Least Recently Used” connection

**uint16\_t `recv_wait_timeout`**  
Timeout for `recv` function (in seconds)

**uint16\_t `send_wait_timeout`**  
Timeout for `send` function (in seconds)

**void \*`global_user_ctx`**  
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

**[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_user_ctx_free_fn`**  
Free function for global user context

**void \*`global_transport_ctx`**  
Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

**[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_transport_ctx_free_fn`**  
Free function for global transport context

**[\*httpd\\_open\\_func\\_t\*](#) `open_fn`**  
Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

**[\*httpd\\_close\\_func\\_t\*](#) `close_fn`**  
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

**[\*httpd\\_uri\\_match\\_func\\_t\*](#) `uri_match_fn`**  
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct `httpd_req`**  
HTTP Request Data Structure.

## Public Members

### *httpd\_handle\_t* **handle**

Handle to server instance

### **int method**

The type of HTTP request, -1 if unsupported method

### **const char uri[HTTPD\_MAX\_URI\_LEN + 1]**

The URI of this request (1 byte extra for null termination)

### **size\_t content\_len**

Length of the request body

### **void \*aux**

Internally used members

### **void \*user\_ctx**

User context pointer passed during URI registration.

### **void \*sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

### *httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

### **bool ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

## **struct httpd\_uri**

Structure for URI handler.

## Public Members

### **const char \*uri**

The URI to handle

### *httpd\_method\_t* **method**

Method supported by the URI

### *esp\_err\_t* (\***handler**) (*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

### **void \*user\_ctx**

Pointer to user context data which will be available to handler

**Macros****HTTPD\_MAX\_REQ\_HDR\_LEN****HTTPD\_MAX\_URI\_LEN****HTTPD SOCK\_ERR\_FAIL****HTTPD SOCK\_ERR\_INVALID****HTTPD SOCK\_ERR\_TIMEOUT****HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**HTTPD\_DEFAULT\_CONFIG ()****ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN**

### Type Definitions

**typedef struct *httpd\_req* httpd\_req\_t**

HTTP Request Data Structure.

**typedef struct *httpd\_uri* httpd\_uri\_t**

Structure for URI handler.

**typedef int (\*httpd\_send\_func\_t) (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)**

Prototype for HTTPDs low-level send function.

**Note** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

#### Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `send()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

**typedef int (\*httpd\_recv\_func\_t) (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)**

Prototype for HTTPDs low-level recv function.

**Note** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

#### Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

**typedef int (\*httpd\_pending\_func\_t) (*httpd\_handle\_t* hd, int sockfd)**

Prototype for HTTPDs low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will be handled accordingly in the server task.

#### Return

- Bytes : The number of bytes waiting to be received
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `pending()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `pending()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor

**typedef *esp\_err\_t* (\*httpd\_err\_handler\_func\_t) (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error)**

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

**Parameters**

- `[in]` `req`: HTTP request for which the error needs to be handled
- `[in]` `error`: Error type

**typedef** void **\*httpd\_handle\_t**  
HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

**typedef** enum http\_method **httpd\_method\_t**  
HTTP Method Type wrapper over “enum http\_method” available in “http\_parser” library.

**typedef** void (**\*httpd\_free\_ctx\_fn\_t**) (void \*ctx)  
Prototype for freeing context data (if any)

**Parameters**

- `[in]` `ctx`: object to free

**typedef** *esp\_err\_t* (**\*httpd\_open\_func\_t**) (*httpd\_handle\_t* hd, int sockfd)  
Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/rcv functions and other parameters of the socket.

**Return**

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

**Parameters**

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

**typedef** void (**\*httpd\_close\_func\_t**) (*httpd\_handle\_t* hd, int sockfd)  
Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

**typedef** bool (**\*httpd\_uri\_match\_func\_t**) (**const** char \*reference\_uri, **const** char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Return** true on match

**Parameters**

- `[in]` `reference_uri`: URI/template with respect to which the other URI is matched
- `[in]` `uri_to_match`: URI/template being matched to the reference URI/template

- [in] `match_upto`: For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**typedef struct *httpd\_config* httpd\_config\_t**

HTTP Server Configuration Structure.

**Note** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**typedef void (\*httpd\_work\_fn\_t) (void \*arg)**

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

#### Parameters

- [in] `arg`: The arguments for this work function

### Enumerations

**enum httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

`HTTPD_500_INTERNAL_SERVER_ERROR = 0`

`HTTPD_501_METHOD_NOT_IMPLEMENTED`

`HTTPD_505_VERSION_NOT_SUPPORTED`

`HTTPD_400_BAD_REQUEST`

`HTTPD_404_NOT_FOUND`

`HTTPD_405_METHOD_NOT_ALLOWED`

`HTTPD_408_REQ_TIMEOUT`

`HTTPD_411_LENGTH_REQUIRED`

`HTTPD_414_URI_TOO_LONG`

`HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`

`HTTPD_ERR_CODE_MAX`

## 2.4.6 HTTPS server

### Overview

This component is built on top of `esp_http_server`. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for `esp_http_server` applies also to a server you create this way.

### Used APIs

The following API of `esp_http_server` should not be used with `esp_https_server`, as they are used internally to handle secure sessions and to maintain internal state:

- “send” , “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`

- `httpd_get_global_transport_ctx()` - returns the shared SSL context
- `httpd_config_t.global_transport_ctx`
- `httpd_config_t.global_transport_ctx_free_fn`
- `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

## Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- [esp\\_https\\_server/include/esp\\_https\\_server.h](#)

### Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t *handle`, `httpd_ssl_config_t *config`)

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

#### Parameters

- [inout] `config`: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] `handle`: - storage for the server handle, must be a valid pointer

void `httpd_ssl_stop` (`httpd_handle_t handle`)

Stop the server. Blocks until the server is shut down.

#### Parameters

- [in] `handle`:

### Structures

`struct httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

### Public Members

`httpd_config_t httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```
const uint8_t *cacert_pem
    CA certificate

size_t cacert_len
    CA certificate byte length

const uint8_t *prvtkey_pem
    Private key

size_t prvtkey_len
    Private key byte length

httpd_ssl_transport_mode_t transport_mode
    Transport Mode (default secure)

uint16_t port_secure
    Port used when transport mode is secure (default 443)

uint16_t port_insecure
    Port used when transport mode is insecure (default 80)
```

### Macros

```
HTTPD_SSL_CONFIG_DEFAULT ()
    Default config struct init

(httpd_server default config had to be copied for customization)
```

Notes:

- port is set when starting the server, according to ‘transport\_mode’
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

### Type Definitions

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

### Enumerations

```
enum httpd_ssl_transport_mode_t
    Values:

    HTTPD_SSL_TRANSPORT_SECURE

    HTTPD_SSL_TRANSPORT_INSECURE
```

## 2.4.7 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
    ↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
    ↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
    ↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,
    ↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
}
```

(continues on next page)

(continued from previous page)

```

freeaddrinfo(res);

esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
ping_config.target_addr = target_addr;           // target IP address
ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↳ping_stop can stop it

/* set callback functions */
esp_ping_callbacks_t cbs;
cbs.on_ping_success = test_on_ping_success;
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
↳can be NULL
cbs.cb_args = eth_event_group;

esp_ping_handle_t ping;
esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- `lwip/include/apps/ping/ping_sock.h`

### Functions

`esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)`

Create a ping session.

#### Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

#### Parameters

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

*esp\_err\_t* **esp\_ping\_delete\_session** (*esp\_ping\_handle\_t* hdl)

Delete a ping session.

**Return**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

**Parameters**

- hdl: handle of ping session

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Return**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

**Parameters**

- hdl: handle of ping session

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Return**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

**Parameters**

- hdl: handle of ping session

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

**Return**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP\_OK: get profile successfully

**Parameters**

- hdl: handle of ping session
- profile: type of profile
- data: profile data
- size: profile data size

## Structures

**struct esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

### Public Members

void \***cb\_args**

arguments for callback functions

void (\***on\_ping\_success**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (\***on\_ping\_timeout**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (\***on\_ping\_end**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

**struct esp\_ping\_config\_t**

Type of "ping" configuration.

### Public Members

- uint32\_t count**  
A “ping” session contains count procedures
- uint32\_t interval\_ms**  
Milliseconds between each ping procedure
- uint32\_t timeout\_ms**  
Timeout value (in milliseconds) of each ping procedure
- uint32\_t data\_size**  
Size of the data next to ICMP packet header
- uint8\_t tos**  
Type of Service, a field specified in the IP header
- ip\_addr\_t target\_addr**  
Target IP address, either IPv4 or IPv6
- uint32\_t task\_stack\_size**  
Stack size of internal ping task
- uint32\_t task\_prio**  
Priority of internal ping task

### Macros

- ESP\_PING\_DEFAULT\_CONFIG()**  
Default ping configuration.
- ESP\_PING\_COUNT\_INFINITE**  
Set ping count to zero will ping target infinitely

### Type Definitions

- typedef void \*esp\_ping\_handle\_t**  
Type of “ping” session handle.

### Enumerations

- enum esp\_ping\_profile\_t**  
Profile of ping session.
- Values:*
- ESP\_PING\_PROF\_SEQNO**  
Sequence number of a ping procedure
- ESP\_PING\_PROF\_TTL**  
Time to live of a ping procedure
- ESP\_PING\_PROF\_REQUEST**  
Number of request packets sent out
- ESP\_PING\_PROF\_REPLY**  
Number of reply packets received
- ESP\_PING\_PROF\_IPADDR**  
IP address of replied target
- ESP\_PING\_PROF\_SIZE**  
Size of received packet
- ESP\_PING\_PROF\_TIMEGAP**  
Elapsed time between request and reply packet

**ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

## 2.4.8 ESP Local Control

### Overview

ESP Local Control (**esp\_local\_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp\_local\_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <----->
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvkey_pem_start[] asm("_binary_prvkey_pem_
↪start");
extern const unsigned char prvkey_pem_end[] asm("_binary_prvkey_pem_
↪end");
https_conf.prvkey_pem = prvkey_pem_start;
https_conf.prvkey_len = prvkey_pem_end - prvkey_pem_start;
```

(continues on next page)

(continued from previous page)

```

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

### Creating a property

Now that we know how to start the **esp\_local\_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp\_local\_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE\_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name       = "timestamp",
    .type       = TYPE_TIMESTAMP,
    .size       = sizeof(int32_t),
    .flags      = READONLY,
    .ctx        = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a *ctx* field, which is set to point to some custom *func\_get\_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get\_prop\_values()* handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {

```

(continues on next page)

(continued from previous page)

```

ESP_LOGI(TAG, "Reading %s", props[i].name);
if (props[i].type == TYPE_TIMESTAMP) {
    /* Obtain the timer function from ctx */
    int32_t (*func_get_time)(void) = props[i].ctx;

    /* Use static variable for saving the value.
     * This is essential because the value has to be
     * valid even after this function returns.
     * Alternative is to use dynamic allocation
     * and set the free_fn field */
    static int32_t ts = func_get_time();
    prop_values[i].data = &ts;
}
}
return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                   const esp_local_ctrl_prop_t *props,
                                   const esp_local_ctrl_prop_val_t_
↳*prop_values,
                                   void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↳props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                   prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

## Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties.

Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

Table 4: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
<code>esp_local_ctrl_version</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</code>	Endpoint used for retrieving version string
<code>esp_local_ctrl_control</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</code>	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- [esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)

### Functions

**const** *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_ble** (void)  
Function for obtaining BLE transport mode.

**const** *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_httpd** (void)  
Function for obtaining HTTPD transport mode.

*esp\_err\_t* **esp\_local\_ctrl\_start** (**const** *esp\_local\_ctrl\_config\_t* \**config*)  
Start local control service.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] *config*: Pointer to configuration structure

*esp\_err\_t* **esp\_local\_ctrl\_stop** (void)  
Stop local control service.

*esp\_err\_t* **esp\_local\_ctrl\_add\_property** (**const** *esp\_local\_ctrl\_prop\_t* \**prop*)  
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] *prop*: Property description structure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (**const** char \**name*)  
Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

**Parameters**

- [in] name: Name of the property to remove

**const** *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (**const** char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

**Return**

- Pointer to property
- NULL if not found

**Parameters**

- [in] name: Name of the property to find

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (**const** char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed to *esp\_local\_ctrl\_start()*.

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Failure

**Parameters**

- [in] ep\_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user\_ctx: User data

**Unions**

**union** *esp\_local\_ctrl\_transport\_config\_t*

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

**Public Members**

*esp\_local\_ctrl\_transport\_config\_ble\_t* \*ble

This is same as *protocomm\_ble\_config\_t*. See *protocomm\_ble.h* for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \*httpd

This is same as *httpd\_ssl\_config\_t*. See *esp\_https\_server.h* for available configuration parameters.

**Structures**

**struct** *esp\_local\_ctrl\_prop*

Property description data structure, which is to be populated and passed to the *esp\_local\_ctrl\_add\_property()* function.

Once a property is added, its structure is available for read-only access inside *get\_prop\_values()* and *set\_prop\_values()* handlers.

**Public Members**

char \*name

Unique name of property

**uint32\_t type**

Type of property. This may be set to application defined enums

**size\_t size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

**uint32\_t flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

**void \*ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

**void (\*ctx\_free\_fn) (void \*ctx)**

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members****void \*data**

Pointer to memory holding property value

**size\_t size**

Size of property value

**void (\*free\_fn) (void \*data)**

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

**esp\_err\_t (\*get\_prop\_values) (size\_t props\_count, const esp\_local\_ctrl\_prop\_t props[], esp\_local\_ctrl\_prop\_val\_t prop\_values[], void \*usr\_ctx)**

Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

**Return** Returning different error codes will convey the corresponding protocol level errors to the client

:

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : InvalidArgument
- `ESP_ERR_INVALID_STATE` : InvalidProto
- All other error codes : InternalError

**Parameters**

- [in] `props_count`: Total elements in the `props` array
- [in] `props`: Array of properties, the current values for which have been requested by the client

- [out] `prop_values`: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by `props` argument
- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

`esp_err_t (*set_prop_values) (size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)`

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : InvalidArgument
- `ESP_ERR_INVALID_STATE` : InvalidProto
- All other error codes : InternalError

#### Parameters

- [in] `props_count`: Total elements in the `props` array
- [in] `props`: Array of properties, the values for which the client requests to change
- [in] `prop_values`: Array of property values, the elements of which need to be used for updating those properties specified by `props` argument
- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

void \***usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (\***usr\_ctx\_free\_fn**) (void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* \***transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

### Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

### Type Definitions

**typedef struct *esp\_local\_ctrl\_prop* esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
```

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

```
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
```

Handlers for receiving and responding to local control commands for getting and setting properties.

```
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
```

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

```
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
```

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

```
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
```

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

```
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
```

Configuration structure to pass to `esp_local_ctrl_start()`

## 2.4.9 mDNS Service

### Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found [on Apple's support page](#). On Linux, mDNS is provided by [avahi](#) and is usually installed by default.

### mDNS Properties

- `hostname`: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: `my-esp32` will resolve to `my-esp32.local`
- `default_instance`: friendly name for your device, like Jhon's ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set `hostname` and `default_instance`:

```
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

**mDNS Services** mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- `instance_name`: friendly name for your service, like Jhon's ESP32 Web Server. If not defined, `default_instance` will be used.
- `service_type`: (required) service type, prepended with underscore. Some common types can be found [here](#).
- `proto`: (required) protocol that the service runs on, prepended with underscore. Example: `_tcp` or `_udp`
- `port`: (required) network port that the service runs on
- `txt`: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32"},
        {"u", "user"},
        {"p", "password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

**mDNS Query** mDNS provides methods for browsing for services and resolving host's IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↳protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

```

Example of using the methods above:

```

void my_app_some_method(){
    //search for esp32-mdns.local
    resolve_mdns_host("esp32-mdns");
}

```

(continues on next page)

(continued from previous page)

```
//search for HTTP servers
find_mdns_service("_http", "_tcp");
//or file servers
find_mdns_service("_smb", "_tcp"); //windows sharing
find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
find_mdns_service("_nfs", "_tcp"); //NFS server
find_mdns_service("_ftp", "_tcp"); //FTP server
//or networked printer
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
}
```

## Application Example

mDNS server/scanner example: [protocols/mdns](#).

## API Reference

### Header File

- [mdns/include/mdns.h](#)

### Functions

*esp\_err\_t* **mdns\_init** (void)

Initialize mDNS on given interface.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE when failed to register event handler
- ESP\_ERR\_NO\_MEM on memory error
- ESP\_FAIL when failed to start mdns task

void **mdns\_free** (void)

Stop and free mDNS server.

*esp\_err\_t* **mdns\_hostname\_set** (const char \*hostname)

Set the hostname for mDNS server required if you want to advertise services.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- hostname: Hostname to set

*esp\_err\_t* **mdns\_instance\_name\_set** (const char \*instance\_name)

Set the default instance name for mDNS server.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- instance\_name: Instance name to set

*esp\_err\_t* **mdns\_service\_add** (const char \*instance\_name, const char \*service\_type, const char \*proto, uint16\_t port, *mdns\_txt\_item\_t* txt[], size\_t num\_items)

Add service to mDNS server.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error
- ESP\_FAIL failed to add service

**Parameters**

- *instance\_name*: instance name to set. If NULL, global instance name or hostname will be used
- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *port*: service port
- *txt*: string array of TXT data (eg. `{{ "var" , " val" },{ "other" , " 2" }}`)
- *num\_items*: number of items in TXT data

*esp\_err\_t* **mdns\_service\_remove** (**const** char \**service\_type*, **const** char \**proto*)

Remove service from mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)

*esp\_err\_t* **mdns\_service\_instance\_name\_set** (**const** char \**service\_type*, **const** char \**proto*,  
**const** char \**instance\_name*)

Set instance name for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *instance\_name*: instance name to set

*esp\_err\_t* **mdns\_service\_port\_set** (**const** char \**service\_type*, **const** char \**proto*, *uint16\_t* *port*)

Set service port.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *port*: service port

*esp\_err\_t* **mdns\_service\_txt\_set** (**const** char \**service\_type*, **const** char \**proto*, *mdns\_txt\_item\_t*  
*txt*[], *uint8\_t* *num\_items*)

Replace all TXT items for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)

- `txt`: array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- `num_items`: number of items in TXT data

*esp\_err\_t* **mdns\_service\_txt\_item\_set** (**const** char \**service\_type*, **const** char \**proto*, **const** char \**key*, **const** char \**value*)

Set/Add TXT item for service TXT record.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

#### Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `key`: the key that you want to add/update
- `value`: the new value of the key

*esp\_err\_t* **mdns\_service\_txt\_item\_remove** (**const** char \**service\_type*, **const** char \**proto*, **const** char \**key*)

Remove TXT item for service TXT record.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

#### Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `key`: the key that you want to remove

*esp\_err\_t* **mdns\_service\_remove\_all** (void)

Remove and free all services from mDNS server.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **mdns\_query** (**const** char \**name*, **const** char \**service\_type*, **const** char \**proto*, `uint16_t` *type*, `uint32_t` *timeout*, `size_t` *max\_results*, `mdns_result_t` \*\**results*)

Query mDNS for host or service All following query methods are derived from this one.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` timeout was not given

#### Parameters

- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (`_http`, `_arduino`, `_ftp` etc.) (NULL for host queries)
- `proto`: service protocol (`_tcp`, `_udp`, etc.) (NULL for host queries)
- `type`: type of query (`MDNS_TYPE_*`)
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

void **mdns\_query\_results\_free** (`mdns_result_t` \**results*)

Free query results.

#### Parameters

- `results`: linked list of results to be freed

*esp\_err\_t* **mdns\_query\_ptr**(**const** char \**service\_type*, **const** char \**proto*, uint32\_t *timeout*, size\_t *max\_results*, *mdns\_result\_t* \*\**results*)

Query mDNS for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *max\_results*: maximum results to be collected
- *results*: pointer to the results of the query

*esp\_err\_t* **mdns\_query\_srv**(**const** char \**instance\_name*, **const** char \**service\_type*, **const** char \**proto*, uint32\_t *timeout*, *mdns\_result\_t* \*\**result*)

Query mDNS for SRV record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- *instance\_name*: service instance name
- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

*esp\_err\_t* **mdns\_query\_txt**(**const** char \**instance\_name*, **const** char \**service\_type*, **const** char \**proto*, uint32\_t *timeout*, *mdns\_result\_t* \*\**result*)

Query mDNS for TXT record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- *instance\_name*: service instance name
- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

*esp\_err\_t* **mdns\_query\_a**(**const** char \**host\_name*, uint32\_t *timeout*, esp\_ip4\_addr\_t \**addr*)

Query mDNS for A record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- *host\_name*: host name to look for
- *timeout*: time in milliseconds to wait for answer.
- *addr*: pointer to the resulting IP4 address

*esp\_err\_t* **mdns\_query\_aaaa**(**const** char \**host\_name*, uint32\_t *timeout*, esp\_ip6\_addr\_t \**addr*)

Query mDNS for A record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- `addr`: pointer to the resulting IP6 address

*esp\_err\_t* **mdns\_handle\_system\_event** (void \*ctx, *system\_event\_t* \*event)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

**Parameters**

- `ctx`: The system event context
- `event`: The system event

**Structures**

**struct mdns\_txt\_item\_t**

mDNS basic text item structure Used in `mdns_service_add()`

**Public Members**

**const char \*key**  
item key name

**const char \*value**  
item value string

**struct mdns\_ip\_addr\_s**

mDNS query linked list IP item

**Public Members**

**esp\_ip\_addr\_t addr**  
IP address

**struct mdns\_ip\_addr\_s \*next**  
next IP, or NULL for the last IP in the list

**struct mdns\_result\_s**

mDNS query result structure

**Public Members**

**struct mdns\_result\_s \*next**  
next result, or NULL for the last result in the list

**mdns\_if\_t tcpip\_if**  
interface index

**mdns\_ip\_protocol\_t ip\_protocol**  
ip\_protocol type of the interface (v4/v6)

**char \*instance\_name**  
instance name

**char \*hostname**  
hostname

`uint16_t port`  
service port

`mdns_txt_item_t *txt`  
txt record

`size_t txt_count`  
number of txt items

`mdns_ip_addr_t *addr`  
linked list of IP addresses found

### Macros

`MDNS_TYPE_A`  
`MDNS_TYPE_PTR`  
`MDNS_TYPE_TXT`  
`MDNS_TYPE_AAAA`  
`MDNS_TYPE_SRV`  
`MDNS_TYPE_OPT`  
`MDNS_TYPE_NSEC`  
`MDNS_TYPE_ANY`

### Type Definitions

`typedef struct mdns_ip_addr_s mdns_ip_addr_t`  
mDNS query linked list IP item

`typedef enum mdns_if_internal mdns_if_t`

`typedef struct mdns_result_s mdns_result_t`  
mDNS query result structure

### Enumerations

`enum mdns_ip_protocol_t`  
mDNS enum to specify the ip\_protocol type

*Values:*

`MDNS_IP_PROTOCOL_V4`  
`MDNS_IP_PROTOCOL_V6`  
`MDNS_IP_PROTOCOL_MAX`

`enum mdns_if_internal`

*Values:*

`MDNS_IF_STA = 0`  
`MDNS_IF_AP = 1`  
`MDNS_IF_ETH = 2`  
`MDNS_IF_MAX`

## 2.4.10 ESP-Modbus

### Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system

that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- `Modbus RTU`—This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- `Modbus ASCII`—This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon ( “:” ) and trailing newline (CR/LF).
- `Modbus TCP/IP` or `Modbus TCP`—This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

**Modbus common interface API overview** The API functions below provide common functionality to setup Modbus stack for slave and master implementation accordingly. ISP-IDF supports Modbus serial slave and master protocol stacks and provides `modbus_controller` interface API to interact with user application.

`esp_err_t mbc_slave_init` (`mb_port_type_t port_type`, `void **handler`)

Initialize Modbus controller and stack.

**Return**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Parameter error

**Parameters**

- [out] `handler`: handler(pointer) to master data structure
- [in] `port_type`: type of stack

`esp_err_t mbc_master_init` (`mb_port_type_t port_type`, `void **handler`)

Initialize Modbus controller and stack.

**Return**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Parameter error

**Parameters**

- [out] `handler`: handler(pointer) to master data structure
- [in] `port_type`: the type of port

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

`esp_err_t mbc_slave_setup` (`void *comm_info`)

Set Modbus communication parameters for the controller.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Incorrect parameter data

**Parameters**

- `comm_info`: Communication parameters structure.

`esp_err_t mbc_master_setup` (`void *comm_info`)

Set Modbus communication parameters for the controller.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Incorrect parameter data

**Parameters**

- `comm_info`: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information.

*mbc\_slave\_set\_descriptor()*: Initialization of slave descriptor.

*mbc\_master\_set\_descriptor()*: Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

*esp\_err\_t* **mbc\_slave\_start** (void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

*esp\_err\_t* **mbc\_master\_start** (void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

*esp\_err\_t* **mbc\_slave\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

*esp\_err\_t* **mbc\_master\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus\_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Selection of Modbus stack support mode” that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

**Modbus serial slave interface API overview** The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus\_controller interface using *mbc\_slave\_set\_descriptor()* API call before start of communication. The interface API functions below are used for Modbus slave application:

*esp\_err\_t* **mbc\_slave\_set\_descriptor** (mb\_register\_area\_descriptor\_t *descr\_data*)

Set Modbus area descriptor.

**Return**

- ESP\_OK: The appropriate descriptor is set
- ESP\_ERR\_INVALID\_ARG: The argument is incorrect

**Parameters**

- *descr\_data*: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the *mbc\_slave\_start()* API is called the Modbus stack can access the data in user data structures by request from master. See the *mb\_register\_area\_descriptor\_t* and example for more information.

`mb_event_group_t mbc_slave_check_event (mb_event_group_t group)`

Wait for specific event on parameter change.

**Return**

- `mb_event_group_t` event bits triggered

**Parameters**

- `group`: Group event bit mask to wait for change

The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return `ESP_OK`. See the `mb_event_group_t` for more information about Modbus event masks.

`esp_err_t mbc_slave_get_param_info (mb_param_info_t *reg_info, uint32_t timeout)`

Get parameter information.

**Return**

- `ESP_OK` Success
- `ESP_ERR_TIMEOUT` Can not get data from parameter queue or queue overflow

**Parameters**

- `[out] reg_info`: parameter info structure
- `timeout`: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig ‘`CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE`’ key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The `mb_param_info_t` structure contain information about accessed parameter.

**Modbus serial master interface API overview** The Modbus master implementation requires parameter description table be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to be assigned to the `modbus_controller` interface using `mbc_master_set_descriptor()` API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

`esp_err_t mbc_master_set_descriptor (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)`

Assign parameter description table for Modbus controller interface.

**Return**

- `esp_err_t ESP_OK` - set descriptor successfully
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument in function call

**Parameters**

- `[in] descriptor`: pointer to parameter description table
- `num_elements`: number of elements in the table

Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular

`esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)`

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

**Return**

- `esp_err_t ESP_OK` - request was successful
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_TIMEOUT` - operation timeout or no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

**Parameters**

- `[in] request`: pointer to request structure of type `mb_param_request_t`

- [in] `data_ptr`: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

```
esp_err_t mbc_master_get_cid_info(uint16_t cid, const mb_parameter_descriptor_t
                                **param_info)
```

Get information about supported characteristic defined as cid. Uses parameter description table to get this information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param\_info. Returns ESP\_ERR\_NOT\_FOUND if characteristic is not supported.

#### Return

- `esp_err_t ESP_OK` - request was successful and buffer contains the supported characteristic name
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_NOT_FOUND` - the characteristic (cid) not found
- `esp_err_t ESP_FAIL` - unknown error during lookup table processing

#### Parameters

- [in] `cid`: characteristic id
- `param_info`: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as cid. It will check if characteristic is supported and returns its description.

```
esp_err_t mbc_master_get_parameter(uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value buffer contains representation of actual parameter data from slave
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_ERR_NOT_FOUND` - the parameter is not found in the parameter description table
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- [in] `cid`: id of the characteristic for parameter
- [in] `name`: pointer into string name (key) of parameter (null terminated)
- [out] `value`: pointer to data buffer of parameter
- [out] `type`: parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

```
esp_err_t mbc_master_set_parameter(uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Set characteristic's value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value was saved in the slave device registers
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave during processing of parameter
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- [in] `cid`: id of the characteristic for parameter

- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic's value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

### Application Example

The examples below use the FreeModbus library port for serial slave and master implementation accordingly. The selection of stack is performed through KConfig menu "Selection of Modbus stack support mode" and related configuration keys.

[protocols/modbus/serial/mb\\_slave](#)

[protocols/modbus/serial/mb\\_master](#)

Please refer to the specific example README.md for details.

### Modbus Readme File

# Modbus assumptions, dependencies and constraints

1. Current implementation of Modbus has limitation: maximum frame size should be less than 120 bytes (default UART receive FIFO full threshold value). This limitation is removed in ESP-IDF v4.2.
2. The only one instance of Modbus port can be initialized at the same time.

## 2.4.11 ESP WebSocket Client

### Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32

### Features

- supports WebSocket over TCP, SSL with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

### Configuration

#### URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://websocket.org`: WebSocket over TCP, default port 80
  - `wss://websocket.org`: WebSocket over SSL, default port 443
- Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
};
```

- If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

## SSL

- Get certificate from server, example: `websocket.org openssl s_client -showcerts -connect websocket.org:443 </dev/null 2>/dev/null|openssl x509 -outform PEM >websocket_org.pem`
- Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

For more options on `esp_websocket_client_config_t`, please refer to API reference below

## Application Example

Simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://websocket.org) Server: [protocols/websocket](https://protocols.websocket.org).

## API Reference

### Header File

- [esp\\_websocket\\_client/include/esp\\_websocket\\_client.h](#)

### Functions

*esp\_websocket\_client\_handle\_t* **esp\_websocket\_client\_init** (**const** *esp\_websocket\_client\_config\_t* \**config*)

Start a WebSocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

#### Return

- `esp_websocket_client_handle_t`
- NULL if any errors

#### Parameters

- [in] *config*: The configuration

*esp\_err\_t* **esp\_websocket\_client\_set\_uri** (*esp\_websocket\_client\_handle\_t* *client*, **const** `char` \**uri*)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

#### Parameters

- [in] *client*: The client
- [in] *uri*: The uri

*esp\_err\_t* **esp\_websocket\_client\_start** (*esp\_websocket\_client\_handle\_t* *client*)

Open the WebSocket connection.

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

`esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)`

Close the WebSocket connection.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- [in] `client`: The client

`esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)`

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- [in] `client`: The client

`int esp_websocket_client_send(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`

Generic write data to the WebSocket connection; defaults to binary send.

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

`int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

`int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

bool **esp\_websocket\_client\_is\_connected** (*esp\_websocket\_client\_handle\_t* client)

Check the WebSocket connection status.

**Return**

- true
- false

**Parameters**

- [in] client: The client handle

*esp\_err\_t* **esp\_websocket\_register\_events** (*esp\_websocket\_client\_handle\_t* client, *esp\_websocket\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Register the WebSocket Events.

**Return** esp\_err\_t

**Parameters**

- client: The client handle
- event: The event id
- event\_handler: The callback function
- event\_handler\_arg: User context

### Structures

**struct esp\_websocket\_event\_data\_t**

WebSocket event data.

#### Public Members

**const char \*data\_ptr**

Data pointer

**int data\_len**

Data length

**uint8\_t op\_code**

Received opcode

*esp\_websocket\_client\_handle\_t* **client**

esp\_websocket\_client\_handle\_t context

**void \*user\_context**

user\_data context, from *esp\_websocket\_client\_config\_t* user\_data

**int payload\_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

**int payload\_offset**

Actual offset for the data associated with this event

**struct esp\_websocket\_client\_config\_t**

WebSocket client setup configuration.

#### Public Members

**const char \*uri**

WebSocket URI, the information on the URI can be overrides the other fields below, if any

**const char \*host**

Domain or IP as string

**int port**

Port to connect, default depend on esp\_websocket\_transport\_t (80 or 443)

**const char \*username**  
Using for Http authentication - Not supported for now

**const char \*password**  
Using for Http authentication - Not supported for now

**const char \*path**  
HTTP Path, if not set, default is /

bool **disable\_auto\_reconnect**  
Disable the automatic reconnect function when disconnected

void **\*user\_context**  
HTTP user data context

int **task\_prio**  
Websocket task priority

int **task\_stack**  
Websocket task stack

int **buffer\_size**  
Websocket buffer size

**const char \*cert\_pem**  
SSL Certification, PEM format as string, if the client requires to verify server

*esp\_websocket\_transport\_t* **transport**  
Websocket transport type, see `esp_websocket_transport_t`

char **\*subprotocol**  
Websocket subprotocol

char **\*user\_agent**  
Websocket user-agent

char **\*headers**  
Websocket additional headers

bool **keep\_alive\_enable**  
Enable keep-alive timeout

int **keep\_alive\_idle**  
Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**  
Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**  
Keep-alive packet retry send count. Default is 3 counts

### Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

```
enum esp_websocket_event_id_t
```

Websocket Client events id.

*Values:*

**WEBSOCKET\_EVENT\_ANY** = -1

**WEBSOCKET\_EVENT\_ERROR** = 0

This event occurs when there are any errors during execution

**WEBSOCKET\_EVENT\_CONNECTED**

Once the Websocket has been connected to the server, no data exchange has been performed

**WEBSOCKET\_EVENT\_DISCONNECTED**

The connection has been disconnected

**WEBSOCKET\_EVENT\_DATA**

When receiving data from the server, possibly multiple portions of the packet

**WEBSOCKET\_EVENT\_MAX****enum esp\_websocket\_transport\_t**

Websocket Client transport.

*Values:*

**WEBSOCKET\_TRANSPORT\_UNKNOWN = 0x0**

Transport unknown

**WEBSOCKET\_TRANSPORT\_OVER\_TCP**

Transport over tcp

**WEBSOCKET\_TRANSPORT\_OVER\_SSL**

Transport over ssl

## 2.4.12 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

For more details about ESP32 SDIO slave protocol, see document [Communication with ESP SDIO Slave](#).

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line.
2. Frhost Interrupts: The master can inform the slave about certain events.

3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

### Initialization of ESP SDIO Slave Link

The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Interrupts

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.
5. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- [esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl.h](#)

### Functions

[esp\\_err\\_t](#) **essl\_init** ([essl\\_handle\\_t](#) handle, uint32\_t wait\_ms)

Initialize the slave.

**Return** ESP\_OK if success, or other value returned from lower layer `init`.

#### Parameters

- handle: Handle of a `essl` device.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

[esp\\_err\\_t](#) **essl\_wait\_for\_ready** ([essl\\_handle\\_t](#) handle, uint32\_t wait\_ms)

Wait for interrupt of a ESP32 slave device.

#### Return

- ESP\_OK if success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

[esp\\_err\\_t](#) **essl\_get\_tx\_buffer\_num** ([essl\\_handle\\_t](#) handle, uint32\_t \*out\_tx\_num, uint32\_t wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Return

- ESP\_OK Success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- out\_tx\_num: Output of buffer num that host can send data to ESP32 slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

[esp\\_err\\_t](#) **essl\_get\_rx\_data\_size** ([essl\\_handle\\_t](#) handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get amount of data the ESP32 slave preparing to send to host.

#### Return

- ESP\_OK Success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- out\_rx\_size: Output of data size to read from slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

[esp\\_err\\_t](#) **essl\_reset\_cnt** ([essl\\_handle\\_t](#) handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

#### Parameters

- handle: Handle of a `essl` device.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESP32 slave. The slave receive the packet into buffers whose size is `buffer_size` (configured during initialization).

**Return**

- ESP\_OK Success
- ESP\_ERR\_TIMEOUT No buffer to use, or error from SDMMC host controller
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of a `essl` device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESP32 slave.

**Return**

- ESP\_OK Success, all the data are read from the slave.
- ESP\_ERR\_NOT\_FINISHED Read success, while there' re data remaining.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of a `essl` device.
- [out] out\_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP\_ERR\_NOT\_FINISHED
- [out] out\_length: Output of length the data actually received from slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESP32 slave.

**Note** sdio 28-31 are reserved, the lower API helps to skip.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Address not valid.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of a `essl` device.
- addr: Address of register to write. Valid address: 0-59.
- value: Value to write to the register.
- value\_o: Output of the returned written value.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESP32 slave.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Address not valid.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of a `essl` device.
- add: Address of register to read. Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read).
- value\_o: Output value read from the register.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_wait\_int** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

wait for an interrupt of the slave

**Return**

- ESP\_ERR\_NOT\_SUPPORTED Currently our driver doesnot support SDIO with SPI interface.
- ESP\_OK If interrupt triggered.
- ESP\_ERR\_TIMEOUT No interrupts before timeout.

**Parameters**

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_clear\_intr** (*essl\_handle\_t* `handle`, *uint32\_t* `intr_mask`, *uint32\_t* `wait_ms`)

Clear interrupt bits of ESP32 slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `intr_mask`: Mask of interrupt bits to clear.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_get\_intr** (*essl\_handle\_t* `handle`, *uint32\_t* \*`intr_raw`, *uint32\_t* \*`intr_st`, *uint32\_t* `wait_ms`)

Get interrupt bits of ESP32 slave.

**Return**

- ESP\_OK Success
- ESP\_INVALID\_ARG if both `intr_raw` and `intr_st` are NULL.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `intr_raw`: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_set\_intr\_ena** (*essl\_handle\_t* `handle`, *uint32\_t* `ena_mask`, *uint32\_t* `wait_ms`)

Set interrupt enable bits of ESP32 slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* `handle`, *uint32\_t* \*`ena_mask_o`, *uint32\_t* `wait_ms`)

Get interrupt enable bits of ESP32 slave.

**Return**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* `handle`, *uint32\_t* `intr_mask`, *uint32\_t* `wait_ms`)

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### Macros

#### **ESP\_ERR\_NOT\_FINISHED**

There is still remaining data.

### Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

### Header File

- `esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h`

### Functions

```
esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)
```

Initialize the ESSL SDIO device and get its handle.

#### Return

- `ESP_OK`: on success
- `ESP_ERR_NO_MEM`: memory exhausted.

#### Parameters

- `out_handle`: Output of the handle.
- `config`: Configuration for the ESSL SDIO device.

```
esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)
```

Deinitialize and free the space used by the ESSL SDIO device.

#### Return

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: wrong handle passed

#### Parameters

- `handle`: Handle of the ESSL SDIO device to deinit.

### Structures

```
struct essl_sdio_config_t
```

Configuration for the `essl` SDIO device.

#### Public Members

```
sdmmc_card_t *card
```

The initialized `sdmmc` card pointer of the slave.

```
int recv_buffer_size
```

The pre-negotiated `recv` buffer size used by both the host and the slave.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

## 2.4.13 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.5 Provisioning API

### 2.5.1 Protocol Communication

#### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

**Following features are available for provisioning :**

- **Communication security at application level -**
  - protocomm\_security0 (no security)
  - protocomm\_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm\_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm\_security1) by performing the two way handshake. See [Unified Provisioning](#) for more details about the secure handshake logic.

#### Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/softap\\_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {

```

(continues on next page)

(continued from previous page)

```

        .data = {
        .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
};

/* Start protocomm server on top of HTTP */
protocomm_httpd_start(pc, &pc_config);

/* Create Proof of Possession object from pop_string. It must be valid
 * throughout the scope of protocomm endpoint. This need not be
↪static,
 * ie. could be dynamically allocated and freed at the time of
↪endpoint
↪removal */
const static protocomm_security_pop_t pop_obj = {
    .data = (const uint8_t *) strdup(pop_string),
    .len = strlen(pop_string)
};

/* Set security for communication at application level. Just like for
 * request handlers, setting security creates an endpoint and
↪registers
 * the handler provided by protocomm_security1. One can similarly use
 * protocomm_security0. Only one type of security can be set for a
 * protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
↪&pop_obj);

/* Private data passed to the endpoint must be valid throughout the
↪scope
 * of protocomm endpoint. This need not be static, ie. could be
↪dynamically
↪allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a
↪unique name
 * and register a handler function along with private data to be
↪passed at the
 * time of handler execution. Multiple endpoints can be added as long
↪as they
 * are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);

return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

(continues on next page)

(continued from previous page)

}

**Transport Example (BLE) with Security 0**For complete example see [provisioning/ble\\_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
→table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can
→be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
→NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
→NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

**API Reference****Header File**

- [protocomm/include/common/protocomm.h](#)

## Functions

*protocomm\_t* \***protocomm\_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the *protocomm\_t* structure initialized to NULL.

### Return

- *protocomm\_t*\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t* \**pc*)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

### Parameters

- [in] *pc*: Pointer to the protocomm instance to be deleted

*esp\_err\_t* **protocomm\_add\_endpoint** (*protocomm\_t* \**pc*, const char \**ep\_name*, *protocomm\_req\_handler\_t* *h*, void \**priv\_data*)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the *protocomm\_t* instance structure.

### Return

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

### Parameters

- [in] *pc*: Pointer to the protocomm instance
- [in] *ep\_name*: Endpoint identifier(name) string
- [in] *h*: Endpoint handler function
- [in] *priv\_data*: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \**pc*, const char \**ep\_name*)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

### Note

- This function internally calls the registered `remove_endpoint()` function which is a member of the *protocomm\_t* instance structure.

### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

### Parameters

- [in] *pc*: Pointer to the protocomm instance
- [in] *ep\_name*: Endpoint identifier(name) string

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \**pc*, uint32\_t *session\_id*)

Allocates internal resources for new transport session.

### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

### Return

- ESP\_OK : Request handled successfully

- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] session_id`: Unique ID for a communication session

`esp_err_t` **protocomm\_close\_session** (`protocomm_t` \**pc*, `uint32_t` *session\_id*)

Frees internal resources used by a transport session.

**Note**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**Return**

- `ESP_OK` : Request handled successfully
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] session_id`: Unique ID for a communication session

`esp_err_t` **protocomm\_req\_handle** (`protocomm_t` \**pc*, `const` `char` \**ep\_name*, `uint32_t` *session\_id*, `const` `uint8_t` \**inbuf*, `ssize_t` *inlen*, `uint8_t` \*\**outbuf*, `ssize_t` \**outlen*)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**

- `ESP_OK` : Request handled successfully
- `ESP_FAIL` : Internal error in execution of registered handler
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string
- `[in] session_id`: Unique ID for a communication session
- `[in] inbuf`: Input buffer contains input request data which is to be processed by the registered handler
- `[in] inlen`: Length of the input buffer
- `[out] outbuf`: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- `[out] outlen`: Buffer length of the allocated output buffer

`esp_err_t` **protocomm\_set\_security** (`protocomm_t` \**pc*, `const` `char` \**ep\_name*, `const` `protocomm_security_t` \**sec*, `const` `protocomm_security_pop_t` \**pop*)

Add endpoint security for a `protocomm` instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

***esp\_err\_t* protocomm\_unset\_security** (*protocomm\_t* \*pc, const char \*ep\_name)  
Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string

***esp\_err\_t* protocomm\_set\_version** (*protocomm\_t* \*pc, const char \*ep\_name, const char \*version)  
Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Version endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string

***esp\_err\_t* protocomm\_unset\_version** (*protocomm\_t* \*pc, const char \*ep\_name)  
Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string

### Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t) (uint32_t session_id, const uint8_t *inbuf,
                                             ssize_t inlen, uint8_t **outbuf, ssize_t *outlen,
                                             void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note** Structure of the protocomm object is kept private

## Header File

- `protocomm/include/security/protocomm_security.h`

## Structures

**struct** `protocomm_security_pop`

Proof Of Possession for authenticating a secure session.

## Public Members

**const** `uint8_t *data`

Pointer to buffer containing the proof of possession data

`uint16_t len`

Length (in bytes) of the proof of possession data

**struct** `protocomm_security`

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

## Public Members

`int ver`

Unique version number of security implementation

`esp_err_t (*init) (protocomm_security_handle_t *handle)`

Function for initializing/allocating security infrastructure

`esp_err_t (*cleanup) (protocomm_security_handle_t handle)`

Function for deallocating security infrastructure

`esp_err_t (*new_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)`

Starts new secure transport session with specified ID

`esp_err_t (*close_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)`

Closes a secure transport session with specified ID

`esp_err_t (*security_req_handler) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Handler function for authenticating connection request and establishing secure session

`esp_err_t (*encrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)`

Function which implements the encryption algorithm

`esp_err_t (*decrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)`

Function which implements the decryption algorithm

## Type Definitions

**typedef struct** `protocomm_security_pop` `protocomm_security_pop_t`

Proof Of Possession for authenticating a secure session.

**typedef** `void *protocomm_security_handle_t`

**typedef struct *protocomm\_security* protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Header File

- [protocomm/include/security/protocomm\\_security0.h](#)

### Header File

- [protocomm/include/security/protocomm\\_security1.h](#)

### Header File

- [protocomm/include/transports/protocomm\\_httpd.h](#)

### Functions

*esp\_err\_t* **protocomm\_httpd\_start** (*protocomm\_t* \*pc, const *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_SUPPORTED : Transport layer bound to another protocomm instance
- ESP\_ERR\_INVALID\_STATE : Transport layer already bound to this protocomm instance
- ESP\_ERR\_NO\_MEM : Memory allocation for server resource failed
- ESP\_ERR\_HTTPD\_\* : HTTP server error on start

#### Parameters

- [in] pc: Protocomm instance pointer obtained from protocomm\_new()
- [in] config: Pointer to config structure for initializing HTTP server

*esp\_err\_t* **protocomm\_httpd\_stop** (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null / incorrect protocomm instance pointer

#### Parameters

- [in] pc: Same protocomm instance that was passed to protocomm\_httpd\_start()

### Unions

**union protocomm\_httpd\_config\_data\_t**

#include <protocomm\_httpd.h> Protocomm HTTPD Configuration Data

### Public Members

void \***handle**

HTTP Server Handle, if ext\_handle\_provided is set to true

***protocomm\_http\_server\_config\_t* config**

HTTP Server Configuration, if a server is not already active

**Structures****struct protocomm\_http\_server\_config\_t**

Config parameters for protocomm HTTP server.

**Public Members****uint16\_t port**

Port on which the HTTP server will listen

**size\_t stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

**unsigned task\_priority**

Priority of server task

**struct protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

**Public Members****bool ext\_handle\_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

***protocomm\_httpd\_config\_data\_t* data**

Protocomm HTTPD Configuration Data

**Macros****PROTOCOLM\_HTTPD\_DEFAULT\_CONFIG ()****Header File**

- [protocomm/include/transport/protocomm\\_ble.h](#)

**Functions*****esp\_err\_t* protocomm\_ble\_start (*protocomm\_t* \*pc, const *protocomm\_ble\_config\_t* \*config)**

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Simple BLE start error
- ESP\_ERR\_NO\_MEM : Error allocating memory for internal resources
- ESP\_ERR\_INVALID\_STATE : Error in ble config
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] pc: Protocomm instance pointer obtained from protocomm\_new()
- [in] config: Pointer to config structure for initializing BLE

***esp\_err\_t* protocomm\_ble\_stop (*protocomm\_t* \*pc)**

Stop Bluetooth Low Energy based transport layer for provisioning.

Stop service/task responsible for BLE based interactions for provisioning

**Note** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

**Parameters**

- `[in] pc`: Same protocomm instance that was passed to `protocomm_ble_start()`

**Structures****struct name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

**const char \*name**

Name of the handler, which is passed to protocomm layer

**uint16\_t uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm\_ble\_config**

Config parameters for protocomm BLE service.

**Public Members**

**char device\_name[MAX\_BLE\_DEVNAME\_LEN]**

BLE device name being broadcast at the time of provisioning

**uint8\_t service\_uuid[BLE\_UUID128\_VAL\_LENGTH]**

128 bit UUID of the provisioning service

**ssize\_t nu\_lookup\_count**

Number of entries in the Name-UUID lookup table

***protocomm\_ble\_name\_uuid\_t* \*nu\_lookup**

Pointer to the Name-UUID lookup table

**Macros**

**MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

**BLE\_UUID128\_VAL\_LENGTH**

**Type Definitions**

**typedef struct *name\_uuid* protocomm\_ble\_name\_uuid\_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**typedef struct *protocomm\_ble\_config* protocomm\_ble\_config\_t**

Config parameters for protocomm BLE service.

## 2.5.2 Unified Provisioning

## Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

## Typical Provisioning Process

### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to "System Settings" to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

### Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

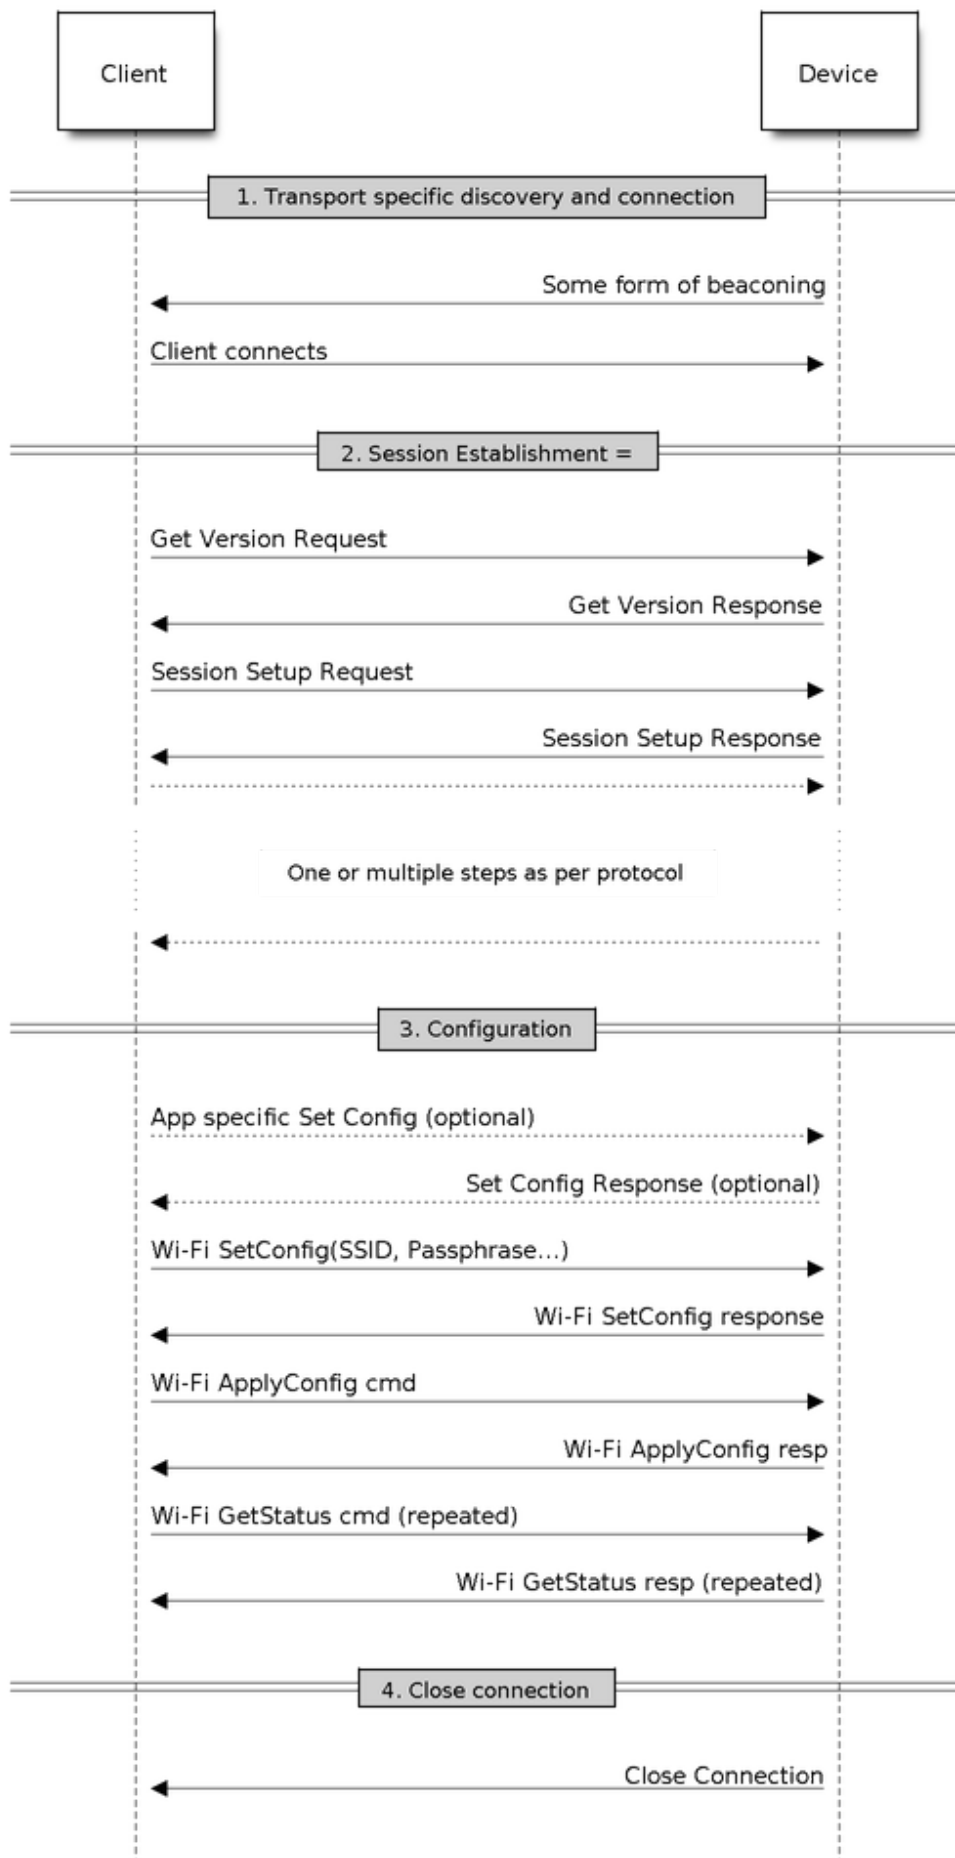

Fig. 23: Typical Provisioning Process

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

### Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

### Architecture

The below diagram shows architecture of unified provisioning.

Fig. 24: Unified Provisioning Architecture

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi

configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

## Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

## Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage.

Various use case implementations can be found as examples under [provisioning](#).

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- Android : [esp-idf-provisioning-android](#)
- iOS : [esp-idf-provisioning-ios](#)
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## 2.5.3 Wi-Fi Provisioning

### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure [Protocol Communication \(protocomm\)](#) sessions. The set of `wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization** `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

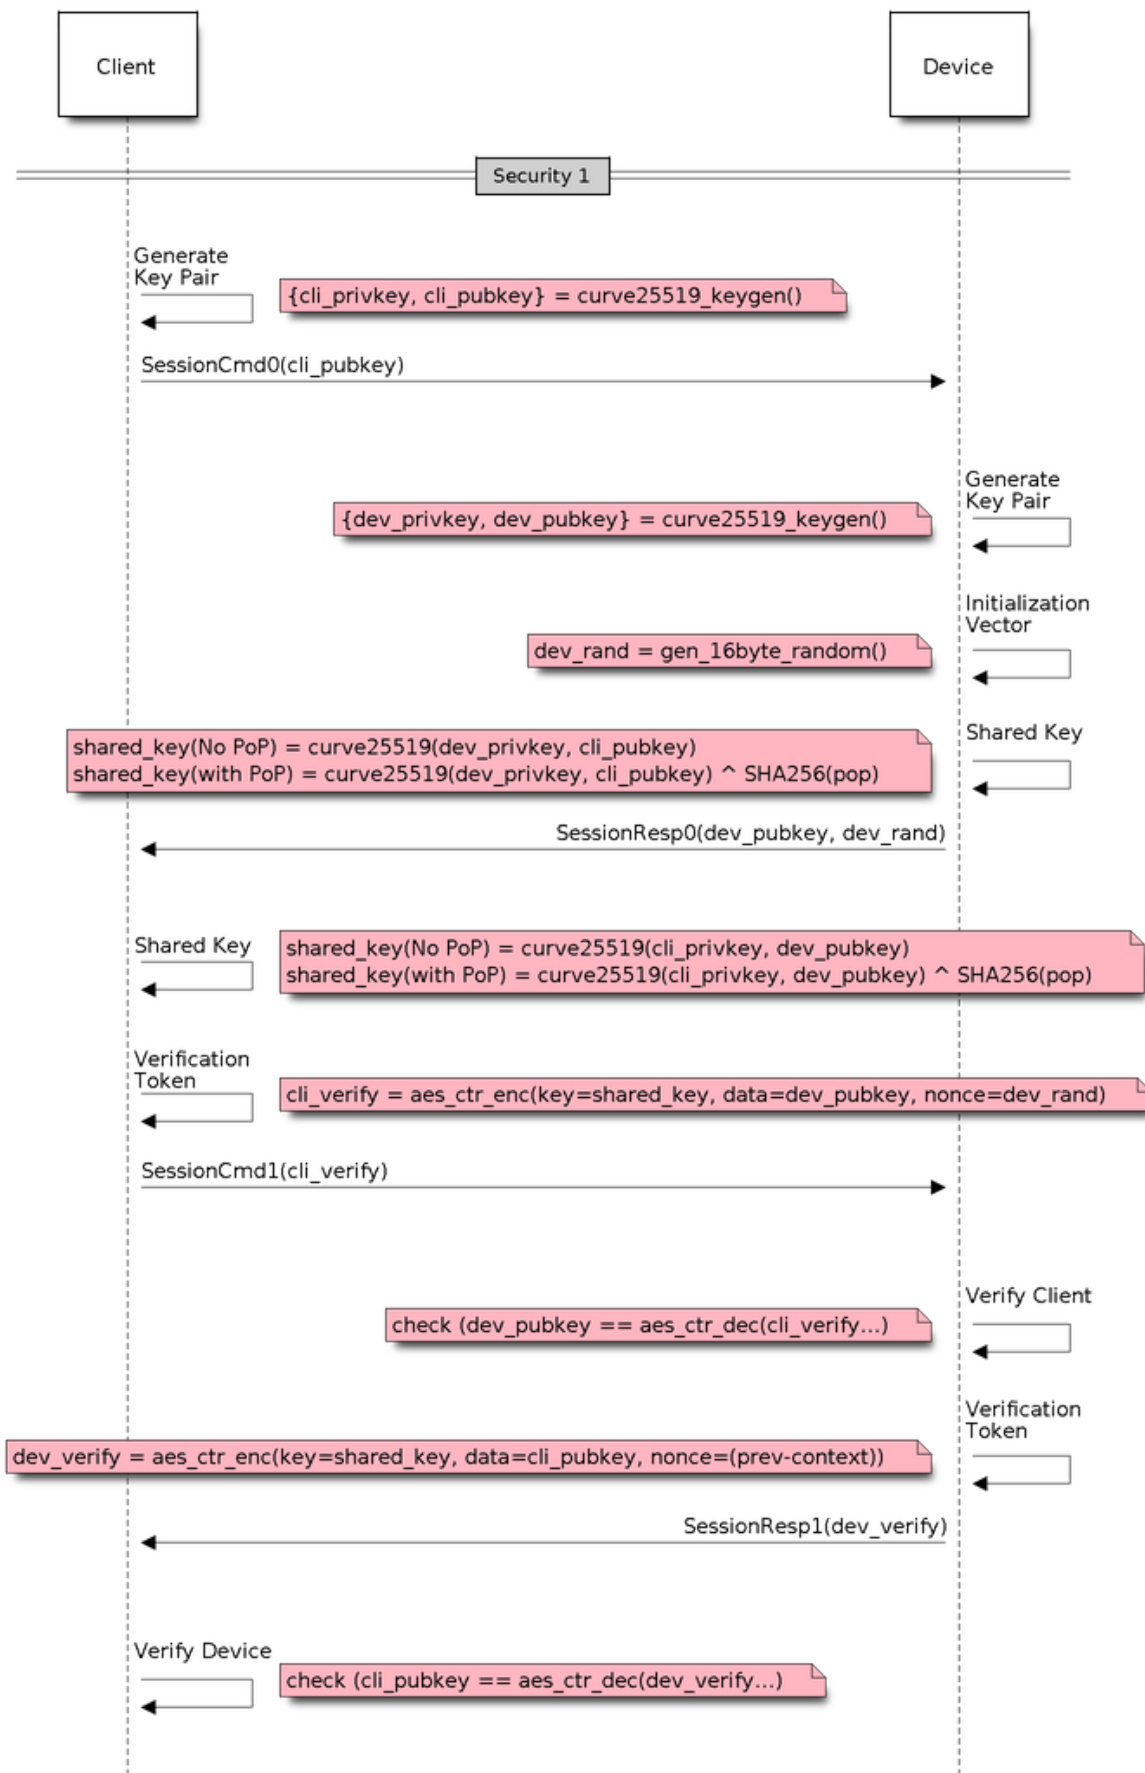

Fig. 25: Security1

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options :
  - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme\_event\_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app\_event\_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT`s` that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↳*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                "\n\tSSID      : %s\n\tPassword : %s",
                (const char *) wifi_sta_cfg->ssid,
                (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↳reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                "\n\tPlease reset to factory and retry_
↳provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi_
↳access-point not found");
            }
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning( security, pop, service_
↳ name, service_key ) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`s` and call `:cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

Table 5: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no\_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my\_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi\_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under `wifi_provisioning/proto`):

- *get\_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set\_config* - For setting the Wi-Fi connection credentials
- *apply\_config* - For applying the credentials saved during *set\_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi\_config* commands described above. The *wifi\_scan* endpoint supports the following protobuf commands:

- *scan\_start* - For starting Wi-Fi scan with various options:
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group\_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting *group\_channels* to 4, will create 5 groups, with each group having 3 channels, except the last one which will have  $14 \% 3 = 2$  channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been

scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- *period\_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan\_status* - Gives the status of scanning process :
  - *scan\_finished* (output) - When scan has finished this returns true
  - *result\_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan\_result* - For fetching scan results. This can be called even if scan is still on going
  - *start\_index* (input) - Starting index from where to fetch the entries from the results list
  - *count* (input) - Number of entries to fetch from the starting index
  - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rss* information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call [wifi\\_prov\\_mgr\\_endpoint\\_unregister\(\)](#) to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the [apply\\_config](#) command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next [get\\_status](#) command. If [get\\_status](#) command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and [get\\_status](#) will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#). Now the provisioning service will only be stopped after an explicit call to [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#), which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI\_PROV\_END event gets emitted. This delay is specified by the argument to [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#).

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#) inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/manager](#)

## API Reference

### Header File

- [wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)

### Functions

*esp\_err\_t* **wifi\_prov\_mgr\_init** (*wifi\_prov\_mgr\_config\_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Fail

#### Parameters

- [in] config: Configuration structure

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call esp\_wifi\_set\_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi\_prov\_mgr\_start\_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

#### Return

- ESP\_OK : Retrieved provision state successfully
- ESP\_FAIL : Wi-Fi not initialized
- ESP\_ERR\_INVALID\_ARG : Null argument supplied
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

#### Parameters

- [out] provisioned: True if provisioned, else false

*esp\_err\_t* **wifi\_prov\_mgr\_start\_provisioning** (*wifi\_prov\_security\_t* security, const char \*pop, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi\_prov\_scheme\_ble : This starts protocomm\_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi\_prov\_scheme\_softap : This activates SoftAP mode of Wi-Fi and starts protocomm\_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type \_esp\_wifi\_prov.\_tcp)

Event WIFI\_PROV\_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

**Return**

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

**Parameters**

- `[in] security`: Specify which protocomm security scheme to use :
  - `WIFI_PROV_SECURITY_0` : For no security
  - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- `[in] pop`: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- `[in] service_name`: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- `[in] service_key`: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

void **wifi\_prov\_mgr\_stop\_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleaup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (*uint32\_t cleanup\_delay*)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Return**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started

**Parameters**

- [in] `cleanup_delay`: Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

*esp\_err\_t* `wifi_prov_mgr_set_app_info` (`const char *label`, `const char *version`, `const char **capabilities`, `size_t total_capabilities`)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Return**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started
- ESP\_ERR\_NO\_MEM : Failed to allocate memory for version string
- ESP\_ERR\_INVALID\_ARG : Null argument

**Parameters**

- [in] `label`: String indicating the application name.
- [in] `version`: String indicating the application version. There is no constraint on format.
- [in] `capabilities`: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] `total_capabilities`: Size of capabilities array

*esp\_err\_t* `wifi_prov_mgr_endpoint_create` (`const char *ep_name`)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Failure

**Parameters**

- [in] `ep_name`: unique name of the endpoint

*esp\_err\_t* `wifi_prov_mgr_endpoint_register` (`const char *ep_name`, `proto-comm_req_handler_t handler`, `void *user_ctx`)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service

is stopped and hence all endpoints are unregistered

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Failure

**Parameters**

- [in] ep\_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user\_ctx: User data

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters**

- [in] ep\_name: Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_event\_handler** (void \*ctx, *system\_event\_t* \*event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

**Note** : This function is DEPRECATED, because events are now handled internally using the event loop library, esp\_event. Calling this will do nothing and simply return ESP\_OK.

**Return**

- ESP\_OK : Event handled successfully

**Parameters**

- [in] ctx: Event context data
- [in] event: Event info

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

**Return**

- ESP\_OK : Successfully retrieved Wi-Fi state
- ESP\_FAIL : Provisioning app not running

**Parameters**

- [out] state: Pointer to wifi\_prov\_sta\_state\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_disconnect\_reason** (*wifi\_prov\_sta\_fail\_reason\_t* \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Return**

- ESP\_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP\_FAIL : Provisioning app not running

**Parameters**

- [out] reason: Pointer to wifi\_prov\_sta\_fail\_reason\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_configure\_sta** (*wifi\_config\_t* \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI\_PROV\_CRED\_RECV is emitted after credentials have been applied and Wi-Fi station started

**Return**

- ESP\_OK : Wi-Fi configured and started successfully
- ESP\_FAIL : Failed to set configuration

**Parameters**

- [in] `wifi_cfg`: Pointer to Wi-Fi configuration structure

**Structures****struct `wifi_prov_event_handler_t`**

Event handler that is used by the manager while provisioning service is active.

**Public Members***wifi\_prov\_cb\_func\_t* **event\_cb**

Callback function to be executed on provisioning events

void **\*user\_data**

User context data to pass as parameter to callback function

**struct `wifi_prov_scheme`**

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

**Public Members***esp\_err\_t* (**\*prov\_start**) (*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

*esp\_err\_t* (**\*prov\_stop**) (*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void **(\*new\_config)** (void)Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*void **(\*delete\_config)** (void \*config)Function which is to be called by the manager to delete a configuration generated using *new\_config()**esp\_err\_t* (**\*set\_config\_service**) (void \*config, **const** char \*service\_name, **const** char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

*esp\_err\_t* (**\*set\_config\_endpoint**) (void \*config, **const** char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

*wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

**struct `wifi_prov_mgr_config_t`**

Structure for specifying the manager configuration.

## Public Members

### *wifi\_prov\_scheme\_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

### *wifi\_prov\_event\_handler\_t* **scheme\_event\_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

### *wifi\_prov\_event\_handler\_t* **app\_event\_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

## Macros

### **WIFI\_PROV\_EVENT\_HANDLER\_NONE**

Event handler can be set to none if not used.

## Type Definitions

```
typedef void (*wifi_prov_cb_func_t) (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

## Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

```
WIFI_PROV_INIT
```

Emitted when the manager is initialized

```
WIFI_PROV_START
```

Indicates that provisioning has started

```
WIFI_PROV_CRED_RECV
```

Emitted when Wi-Fi AP credentials are received via protocomm endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

**WIFI\_PROV\_CRED\_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

**WIFI\_PROV\_CRED\_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

**WIFI\_PROV\_END**

Signals that provisioning service has stopped

**WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

**enum wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

*Values:*

**WIFI\_PROV\_SECURITY\_0 = 0**

No security (plain-text communication)

**WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)

**Functions**

```
void wifi_prov_scheme_ble_event_cb_free_bt(dm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
```

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

**Parameters**

- `[in] uuid128`: A custom 128 bit UUID

**Macros**

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
```

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
```

**WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BT****Header File**

- `wifi_provisioning/include/wifi_provisioning/scheme_softap.h`

**Functions**

void **wifi\_prov\_scheme\_softap\_set\_httpd\_handle** (void \**handle*)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note** This API should be called before `wifi_prov_mgr_start_provisioning()`

**Parameters**

- [in] `handle`: Handle to HTTPD server instance

**Header File**

- `wifi_provisioning/include/wifi_provisioning/scheme_console.h`

**Header File**

- `wifi_provisioning/include/wifi_provisioning/wifi_config.h`

**Functions**

*esp\_err\_t* **wifi\_prov\_config\_data\_handler** (uint32\_t *session\_id*, const uint8\_t \**inbuf*, ssize\_t *inlen*, uint8\_t \*\**outbuf*, ssize\_t \**outlen*, void \**priv\_data*)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

**Structures**

**struct wifi\_prov\_sta\_conn\_info\_t**

WiFi STA connected status information.

**Public Members**

char **ip\_addr**[IP4ADDR\_STRLEN\_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8\_t **channel**

Channel of the AP

uint8\_t **auth\_mode**

Authorization mode of the AP

**struct wifi\_prov\_config\_get\_data\_t**

WiFi status data to be sent in response to `get_status` request from master.

### Public Members

*wifi\_prov\_sta\_state\_t* **wifi\_state**

WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**

Reason for disconnection (valid only when *wifi\_state* is `WIFI_STATION_DISCONNECTED`)

*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**

Connection information (valid only when *wifi\_state* is `WIFI_STATION_CONNECTED`)

**struct wifi\_prov\_config\_set\_data\_t**

WiFi config data received by slave during `set_config` request from master.

### Public Members

char **ssid**[33]

SSID of the AP to which the slave is to be connected

char **password**[64]

Password of the AP

char **bssid**[6]

BSSID of the AP

uint8\_t **channel**

Channel of the AP

**struct wifi\_prov\_config\_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Public Members

*esp\_err\_t* (**\*get\_status\_handler**) (*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (**\*set\_config\_handler**) (**const** *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (**\*apply\_config\_handler**) (*wifi\_prov\_ctx\_t* \*\*ctx)

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

*wifi\_prov\_ctx\_t* \*ctx

Context pointer to be passed to above handler functions upon invocation

### Type Definitions

**typedef struct** *wifi\_prov\_ctx* **wifi\_prov\_ctx\_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

**typedef struct** *wifi\_prov\_config\_handlers* **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for `protocomm` request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

#### `enum wifi_prov_sta_state_t`

WiFi STA status for conveying back to the provisioning master.

Values:

`WIFI_PROV_STA_CONNECTING`

`WIFI_PROV_STA_CONNECTED`

`WIFI_PROV_STA_DISCONNECTED`

#### `enum wifi_prov_sta_fail_reason_t`

WiFi STA connection fail reason.

Values:

`WIFI_PROV_STA_AUTH_ERROR`

`WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for this API section are provided in the [provisioning](#) directory of ESP-IDF examples.

## 2.6 Storage API

### 2.6.1 FAT Filesystem Support

ESP-IDF uses the [FatFs](#) library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

#### Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
  - Path prefix where to mount the filesystem (e.g. `"/sdcard"`, `"/spiflash"`)
  - FatFs drive number
  - A variable which will receive the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see *FatFs documentation* <<http://www.elm-chan.org/ffsw/ff/doc/mount.html>>.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, `"/sdcard/hello.txt"`).
5. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
6. Close all open files.

7. Call the FatFs function `f_mount` for the same drive number, with `NULL` `FATFS*` argument, to unmount the filesystem.
8. Call the FatFs function `ff_diskio_register()` with `NULL` `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
9. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the `FATFS` structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_sdmmc_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

**`esp_err_t esp_vfs_fat_register`** (`const` char \**base\_path*, `const` char \**fat\_drive*, `size_t` *max\_files*, `FATFS` \*\**out\_fs*)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates `FATFS` structure which should be used for `f_mount` call.

**Note** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

#### Parameters

- `base_path`: path prefix where FATFS should be registered
- `fat_drive`: FATFS drive specification; if only one drive is used, can be an empty string
- `max_files`: maximum number of files which can be open at the same time
- [`out`] `out_fs`: pointer to `FATFS` structure which can be used for FATFS `f_mount` call is returned via this argument.

**`esp_err_t esp_vfs_fat_unregister_path`** (`const` char \**base\_path*)

Un-register FATFS from VFS.

**Note** `FATFS` structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_path`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `FATFS` is not registered in VFS

#### Parameters

- `base_path`: path prefix where `FATFS` is registered. This is the same used when `esp_vfs_fat_register` was called

## Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()` and `esp_vfs_fat_sdmmc_unmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

**`esp_err_t esp_vfs_fat_sdmmc_mount`** (`const` char \**base\_path*, `const` `sdmmc_host_t` \**host\_config*, `const` void \**slot\_config*, `const` `esp_vfs_fat_mount_config_t` \**mount\_config*, `sdmmc_card_t` \*\**out\_card*)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`

- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**Parameters**

- `base_path`: path where partition should be registered (e.g. `"/sdcard"` )
- `host_config`: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: if not `NULL`, pointer to the card information structure will be returned via this argument

**struct esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

**Public Members****bool format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

**int max\_files**

Max number of open files.

**size\_t allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and  $128 * \text{sector size}$ . For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

**esp\_err\_t esp\_vfs\_fat\_sdmmc\_unmount (void)**

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` hasn't been called

**Using FatFs with VFS in read-only mode**

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_rawflash_mount()` and `esp_vfs_fat_rawflash_unmount()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for

data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```
esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label,
                                     const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_rawflash\_mount was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

#### Parameters

- base\_path: path where FATFS partition should be mounted (e.g. “/spiflash” )
- partition\_label: label of the partition which should be used
- mount\_config: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount (const char *base_path, const char
                                       *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp\_vfs\_fat\_rawflash\_mount.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount hasn't been called

#### Parameters

- base\_path: path where partition should be registered (e.g. “/spiflash” )
- partition\_label: label of partition to be unmounted

## FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk\_xxx functions for driver number pdrv, corresponding function in discio\_impl for given pdrv will be called.

#### Parameters

- pdrv: drive number
- discio\_impl: pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

### Public Members

DSTATUS (**\*init**) (unsigned char pdrv)  
disk initialization function

DSTATUS (**\*status**) (unsigned char pdrv)  
disk status check function

DRESULT (**\*read**) (unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)  
sector read function

DRESULT (**\*write**) (unsigned char pdrv, **const** unsigned char \*buff, uint32\_t sector, unsigned count)  
sector write function

DRESULT (**\*ioctl**) (unsigned char pdrv, unsigned char cmd, void \*buff)  
function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmmc** (unsigned char pdrv, *sdmmc\_card\_t* \*card)  
Register SD/MMC diskio driver

#### Parameters

- pdrv: drive number
- card: pointer to *sdmmc\_card\_t* structure describing a card; card should be initialized before calling `f_mount`.

*esp\_err\_t* **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, *wl\_handle\_t* flash\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- flash\_handle: handle of the wear levelling partition.

*esp\_err\_t* **ff\_diskio\_register\_raw\_partition** (unsigned char pdrv, **const** *esp\_partition\_t* \*part\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- part\_handle: pointer to raw flash partition.

## 2.6.2 Manufacturing Utility

### Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only)
- Direct flash programming

### Prerequisites

This utility is dependent on `esp-idf`'s NVS partition utility.

- **Operating System requirements:**
  - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**

– Python: <<https://www.python.org/downloads/>>

---

**Note:****Before using this utility, please make sure that:**

- The path to Python is added to the PATH environment variable.
  - You have installed the packages from *requirement.txt*, the file in the root of the esp-idf directory.
- 

**Workflow****CSV Configuration File**

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,    <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

---

**Note:** The first line in this file should always be the namespace entry.

---

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

---

**Note:****Make sure there are no spaces:**

- before and after ‘,’
  - at the end of each line in a CSV file
- 

**Master Value CSV File**

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

---

The data in the master value CSV file has the following format:

```
key1, key2, key3, . . . . .
value1, value2, value3, . . . .
```

**Note:** The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the `value` of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id, firmware_key, serial_no, device_no
1, 1a2b3c4d5e6faabb, A1, 101
2, 1a2b3c4d5e6fccdd, , 102
3, 1a2b3c4d5e6feeff, , 103
```

**Note:** If the `'REPEAT'` tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the `'REPEAT'` tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key, type, encoding, value
key, namespace, ,
key1, type1, encoding1, value1
key2, type2, encoding2, value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

## Running the utility

### Usage:

```
python mfg_gen.py [-h] {generate, generate-key} ...
```

Optional Arguments:

```
+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪      |
+-----+-----+-----+-----+-----+-----+
| 1   | -h, --help | show this help message and exit |
↪      |
+-----+-----+-----+-----+
↪-----+

```

Commands:

(continues on next page)

(continued from previous page)

```

Run mfg_gen.py {command} -h for additional help
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | generate | Generate NVS partition |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 2 | generate-key | Generate keys for encryption |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

**To generate factory images for each device (Default): Usage:**

```

python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                        [--keyfile KEYFILE] [--inputkey INPUTKEY]
                        [--outdir OUTDIR]
                        conf values prefix size

Positional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| conf | Path to configuration csv file to parse |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| values | Path to values csv file to parse |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| prefix | Unique name for each output filename prefix |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| size | Size of NVS partition in bytes |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| | (must be multiple of 4096) |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

Optional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| -h, --help | show this help message and exit |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| --fileid FILEID | Unique file identifier(any key in values file) |
↪-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| | for each filename suffix (Default: numeric value(1,
↪2,3...)) |

```

(continues on next page)

(continued from previous page)

<code>--version {1,2}</code>	Set multipage blob version.
	Version 1 - Multipage blob support disabled.
	Version 2 - Multipage blob support enabled.
	Default: Version 2
<code>--keygen</code>	Generates key <b>for</b> encrypting NVS partition
<code>--inputkey INPUTKEY</code>	File having key <b>for</b> encrypting NVS partition
<code>--outdir OUTDIR</code>	Output directory to store files created (Default: current directory)

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csmples/sample_values_singlepage_
↳blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

#### To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

**To generate only encryption keys: Usage:**

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

Parameter	Description
<code>-h, --help</code>	show this help message <b>and</b> exit
<code>--keyfile KEYFILE</code>	Path to output encryption keys file
<code>--outdir OUTDIR</code>	Output directory to store files created. (Default: current directory)

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

**Note:** To provide custom target filename use the `-keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.6.3 Non-volatile storage library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying storage** Currently, NVS uses a portion of main flash memory through `spi_flash_{read|write|erase}` APIs. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open` API function or any other partition by specifying its name using the `nvs_open_from_part` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

---

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase_flash` target to erase all contents of the flash chip.

---

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

---

**Keys and values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

---

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

---

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- if the new value is of the same type as the old one, value is updated
- if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the `nvs_open` or `nvs_open_from_part` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**Security, tampering, and robustness** NVS is not directly compatible with the `{IDF_TARGET_NAME}` flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with `{IDF_TARGET_NAME}` flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

## Internals

**Log of key-value pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

**Empty/uninitialized** Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

**Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

**Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

**Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

**Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

**Structure of a page** For now, we assume that flash sector size is 4096 bytes and that `{IDF_TARGET_NAME}` flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via `menuconfig`) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with `{IDF_TARGET_NAME}` flash encryption, entry size is 32 bytes. For integer types, entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

(continues on next page)

(continued from previous page)

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of {IDF\_TARGET\_NAME} is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

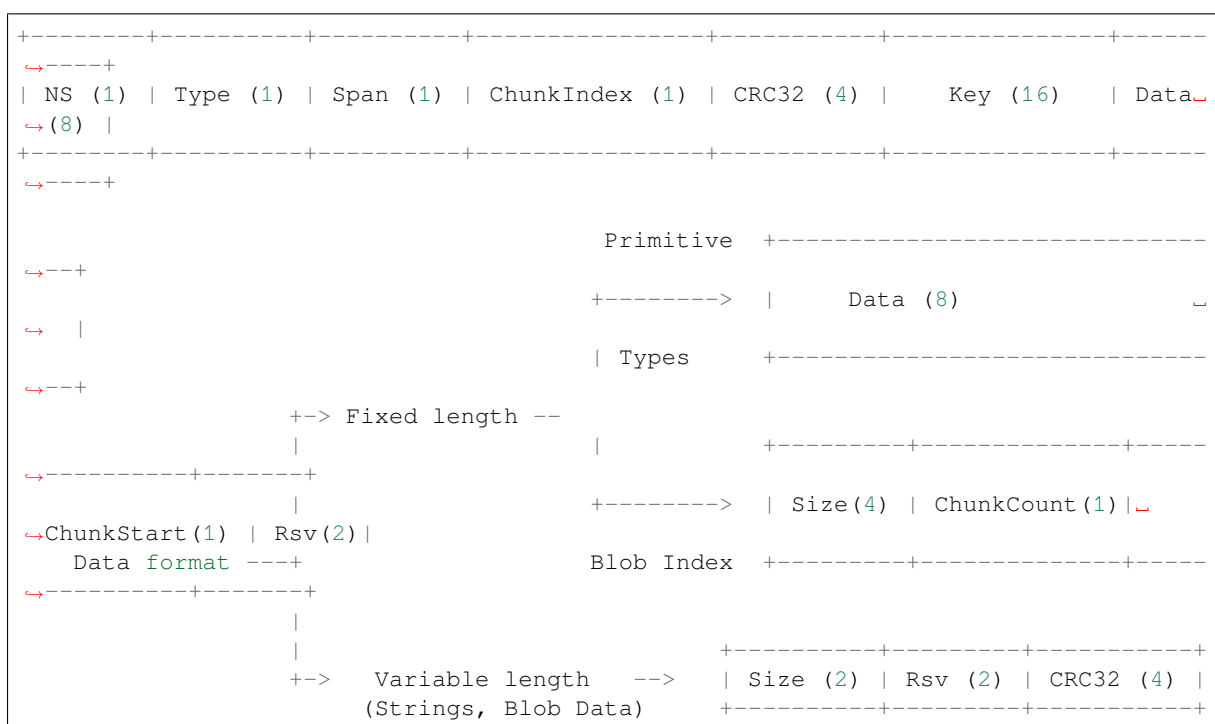

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 \* 126) are not used.

**Empty (2' b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2' b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2' b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

```

+-----+-----+
| NS=0 Type=uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi"
+-----+-----+
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi"
+-----+-----+
| NS=0 Type=uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm"
+-----+-----+
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm"
+-----+-----+

```

**Item hash list** To reduce the number of reads from flash memory, each member of the `Page` class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and `ChunkIndex`. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

## NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

**NVS key partition** An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted*. Refer to *Partition Tables* for more details. The size of the partition should be 4096 bytes (minimum partition size). The structure of this partition is depicted below.

This partition can be generated using *nvs partition generator* utility and flashed onto the device. Since the partition is marked *encrypted* and *Flash Encryption* is enabled, bootloader will encrypt this partition using flash encryption key on the first boot. Alternatively, the keys can be generated after startup using the `nvs_flash_generate_keys` API function provided by `nvs_flash.h`, which will then write those keys onto the key-partition in encrypted form.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write** The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well. However, the API functions for initialising NVS partitions are different: `nvs_flash_secure_init` and `nvs_flash_secure_init_partition` instead of `nvs_flash_init` and `nvs_flash_init_partition` respectively. The `nvs_sec_cfg_t` structure required for these API functions can be populated using `nvs_flash_generate_keys` or `nvs_flash_read_security_cfg`.

Applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg` or `nvs_flash_generate_keys` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init` or `nvs_flash_secure_init_partition` API functions.
4. Open a namespace using the `nvs_open` or `nvs_open_from_part` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit`.

**NVS iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next` and `nvs_entry_info` functions.
- `nvs_entry_next` returns iterator to the next key-value pair.
- `nvs_entry_info` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find` and `nvs_entry_next` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator`.

### NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

## Application Example

You can find two code examples in the [storage](#) directory of ESP-IDF examples:

### [storage/nvs\\_rw\\_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

### [storage/nvs\\_rw\\_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- value - tracks the number of the ESP32 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

### [storage/nvs\\_rw\\_value\\_cxx](#)

This example does exactly the same as [storage/nvs\\_rw\\_value](#), except that it uses the C++ nvs handle class.

## API Reference

### Header File

- [nvs\\_flash/include/nvs\\_flash.h](#)

### Functions

*esp\_err\_t* **nvs\_flash\_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

#### Return

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_init\_partition** (const char \**partition\_label*)

Initialize NVS flash storage for the specified partition.

#### Return

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

#### Parameters

- [in] *partition\_label*: Label of the partition. Must be no longer than 16 characters.

*esp\_err\_t* **nvs\_flash\_init\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Initialize NVS flash storage for the partition specified by partition pointer.

**Return**

- ESP\_OK if storage was successfully initialized
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] partition: pointer to a partition obtained by the ESP partition API.

*esp\_err\_t* **nvs\_flash\_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Return**

- ESP\_OK on success (storage was deinitialized)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_deinit\_partition** (const char \*partition\_label)

Deinitialize NVS storage for the given NVS partition.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage for given partition was not initialized prior to this call

**Parameters**

- [in] partition\_label: Label of the partition

*esp\_err\_t* **nvs\_flash\_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs” ).

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition** (const char \*part\_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

**Parameters**

- [in] part\_name: Name (label) of the partition which should be erased

*esp\_err\_t* **nvs\_flash\_erase\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Erase custom partition.

Erase all content of specified custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success

- ESP\_ERR\_NOT\_FOUND if there is no partition with the specified parameters in the partition table
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] *partition*: pointer to a partition obtained by the ESP partition API.

*esp\_err\_t* **nvs\_flash\_secure\_init** (*nvs\_sec\_cfg\_t* \**cfg*)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] *cfg*: Security configuration (keys) to be used for NVS encryption/decryption. If *cfg* is NULL, no encryption is used.

*esp\_err\_t* **nvs\_flash\_secure\_init\_partition** (**const** char \**partition\_label*, *nvs\_sec\_cfg\_t* \**cfg*)

Initialize NVS flash storage for the specified partition.

**Return**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] *partition\_label*: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- [in] *cfg*: Security configuration (keys) to be used for NVS encryption/decryption. If *cfg* is null, no encryption/decryption is used.

*esp\_err\_t* **nvs\_flash\_generate\_keys** (**const** *esp\_partition\_t* \**partition*, *nvs\_sec\_cfg\_t* \**cfg*)

Generate and store NVS keys in the provided esp partition.

**Return** -ESP\_OK, if *cfg* was read successfully; -or error codes from *esp\_partition\_write/erase* APIs.

**Parameters**

- [in] *partition*: Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.
- [out] *cfg*: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

*esp\_err\_t* **nvs\_flash\_read\_security\_cfg** (**const** *esp\_partition\_t* \**partition*, *nvs\_sec\_cfg\_t* \**cfg*)

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked ‘encrypted’ .

**Return** -ESP\_OK, if *cfg* was read successfully; -ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED, if the partition is not yet written with keys. -ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART, if the partition containing keys is found to be corrupt -or error codes from *esp\_partition\_read* API.

**Parameters**

- [in] *partition*: Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.
- [out] *cfg*: Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Structures**

**struct** *nvs\_sec\_cfg\_t*

Key for encryption and decryption.

## Public Members

`uint8_t eky[NVS_KEY_SIZE]`  
XTS encryption and decryption key

`uint8_t tky[NVS_KEY_SIZE]`  
XTS tweak key

## Macros

`NVS_KEY_SIZE`

## Header File

- [nvs\\_flash/include/nvs.h](#)

## Functions

`esp_err_t nvs_set_i8(nvs_handle_t handle, const char *key, int8_t value)`  
set int8\_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

### Return

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

### Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- [in] `value`: The value to set.

`esp_err_t nvs_set_u8(nvs_handle_t handle, const char *key, uint8_t value)`  
set uint8\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16(nvs_handle_t handle, const char *key, int16_t value)`  
set int16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16(nvs_handle_t handle, const char *key, uint16_t value)`  
set uint16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32(nvs_handle_t handle, const char *key, int32_t value)`  
set int32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32(nvs_handle_t handle, const char *key, uint32_t value)`  
set uint32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_i64** (*nvs\_handle\_t* handle, **const** char \*key, int64\_t value)  
set int64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_u64** (*nvs\_handle\_t* handle, **const** char \*key, uint64\_t value)  
set uint64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_str** (*nvs\_handle\_t* handle, **const** char \*key, **const** char \*value)  
set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

#### Return

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

#### Parameters

- [in] handle: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

*esp\_err\_t* **nvs\_get\_i8** (*nvs\_handle\_t* handle, **const** char \*key, int8\_t \*out\_value)  
get int8\_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

#### Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

#### Parameters

- [in] handle: Handle obtained from `nvs_open` function.
- [in] key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.

- `out_value`: Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

`esp_err_t nvs_get_u8` (*nvs\_handle\_t* handle, **const** char \*key, uint8\_t \*out\_value)  
get uint8\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16` (*nvs\_handle\_t* handle, **const** char \*key, int16\_t \*out\_value)  
get int16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16` (*nvs\_handle\_t* handle, **const** char \*key, uint16\_t \*out\_value)  
get uint16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32` (*nvs\_handle\_t* handle, **const** char \*key, int32\_t \*out\_value)  
get int32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32` (*nvs\_handle\_t* handle, **const** char \*key, uint32\_t \*out\_value)  
get uint32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64` (*nvs\_handle\_t* handle, **const** char \*key, int64\_t \*out\_value)  
get int64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64` (*nvs\_handle\_t* handle, **const** char \*key, uint64\_t \*out\_value)  
get uint64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str` (*nvs\_handle\_t* handle, **const** char \*key, char \*out\_value, size\_t \*length)  
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into_
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

## Return

- ESP\_OK if the value was retrieved successfully
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_INVALID\_LENGTH if length is not sufficient to store data

#### Parameters

- [in] handle: Handle obtained from nvs\_open function.
- [in] key: Key name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- [out] out\_value: Pointer to the output value. May be NULL for nvs\_get\_str and nvs\_get\_blob, in this case required length will be returned in length argument.
- [inout] length: A non-zero pointer to the variable holding the length of out\_value. In case out\_value a zero, will be set to the length required to hold the value. In case out\_value is not zero, will be set to the actual length of the value written. For nvs\_get\_str this includes zero terminator.

*esp\_err\_t* nvs\_get\_blob(*nvs\_handle\_t* handle, const char \*key, void \*out\_value, size\_t \*length)  
get blob value for given key

This function behaves the same as nvs\_get\_str, except for the data type.

*esp\_err\_t* nvs\_open(const char \*name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)  
Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

#### Return

- ESP\_OK if storage handle was opened successfully
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label "nvs" is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- other error codes from the underlying storage driver

#### Parameters

- [in] name: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- [in] open\_mode: NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out\_handle: If successful (return code is zero), handle will be returned in this argument.

*esp\_err\_t* nvs\_open\_from\_partition(const char \*part\_name, const char \*name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)  
Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs\_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs\_flash\_init\_partition() API.

#### Return

- ESP\_OK if storage handle was opened successfully
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with specified name is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- other error codes from the underlying storage driver

#### Parameters

- [in] part\_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- [in] open\_mode: NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.

- [out] `out_handle`: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)`  
set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

#### Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is 15 characters. Shouldn't be empty.
- [in] `value`: The value to set.
- [in] `length`: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`  
Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if erase operation was successful
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- other error codes from the underlying storage driver

#### Parameters

- [in] `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.

`esp_err_t nvs_erase_all(nvs_handle_t handle)`  
Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if erase operation was successful
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

#### Parameters

- [in] `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

`esp_err_t nvs_commit(nvs_handle_t handle)`  
Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**

- ESP\_OK if the changes have been written successfully
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**Parameters**

- [in] handle: Storage handle obtained with nvs\_open. Handles that were opened read only cannot be used.

void **nvs\_close** (*nvs\_handle\_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs\_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs\_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**

- [in] handle: Storage handle to close

*esp\_err\_t* **nvs\_get\_stats** (**const** char \*part\_name, *nvs\_stats\_t* \*nvs\_stats)

Fill structure *nvs\_stats\_t*. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
↳entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↳entries);
```

**Return**

- ESP\_OK if the changes have been written successfully. Return param nvs\_stats will be filled.
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label "name" is not found. Return param nvs\_stats will be filled 0.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param nvs\_stats will be filled 0.
- ESP\_ERR\_INVALID\_ARG if nvs\_stats equal to NULL.
- ESP\_ERR\_INVALID\_STATE if there is page with the status of INVALID. Return param nvs\_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

**Parameters**

- [in] part\_name: Partition name NVS in the partition table. If pass a NULL than will use NVS\_DEFAULT\_PART\_NAME ("nvs").
- [out] nvs\_stats: Returns filled structure nvs\_states\_t. It provides info about used memory the partition.

*esp\_err\_t* **nvs\_get\_used\_entry\_count** (*nvs\_handle\_t* handle, size\_t \*used\_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used\_entries (if err is equal to ESP\_OK). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs_
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
```

(continues on next page)

(continued from previous page)

```

if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}

```

**Return**

- ESP\_OK if the changes have been written successfully. Return param used\_entries will be filled valid value.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param used\_entries will be filled 0.
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL. Return param used\_entries will be filled 0.
- ESP\_ERR\_INVALID\_ARG if used\_entries equal to NULL.
- Other error codes from the underlying storage driver. Return param used\_entries will be filled 0.

**Parameters**

- [in] handle: Handle obtained from nvs\_open function.
- [out] used\_entries: Returns amount of used entries from a namespace.

*nvs\_iterator\_t* **nvs\_entry\_find**(const char \*part\_name, const char \*namespace\_name, *nvs\_type\_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```

// Example of listing all the key-value pairs of any type under specified_
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
//       nvs_entry_find or nvs_entry_next function return NULL, indicating no_
↳other
//       element for specified criteria was found.
}

```

**Return** Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using nvs\_release\_iterator when not used any more.

**Parameters**

- [in] part\_name: Partition name
- [in] namespace\_name: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- [in] type: One of nvs\_type\_t values.

*nvs\_iterator\_t* **nvs\_entry\_next** (*nvs\_iterator\_t* iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid nvs\_iterator\_t otherwise.

**Parameters**

- [in] iterator: Iterator obtained from nvs\_entry\_find function. Must be non-NULL.

void **nvs\_entry\_info** (*nvs\_iterator\_t* iterator, *nvs\_entry\_info\_t* \*out\_info)

Fills *nvs\_entry\_info\_t* structure with information about entry pointed to by the iterator.

**Parameters**

- [in] iterator: Iterator obtained from nvs\_entry\_find or nvs\_entry\_next function. Must be non-NULL.
- [out] out\_info: Structure to which entry information is copied.

void **nvs\_release\_iterator** (*nvs\_iterator\_t* iterator)

Release iterator.

#### Parameters

- [in] *iterator*: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

#### Structures

**struct nvs\_entry\_info\_t**

information about entry obtained from `nvs_entry_info` function

#### Public Members

char **namespace\_name**[16]

Namespace to which key-value belong

char **key**[NVS\_KEY\_NAME\_MAX\_SIZE]

Key of stored key-value pair

*nvs\_type\_t* **type**

Type of stored key-value pair

**struct nvs\_stats\_t**

**Note** Info about storage space NVS.

#### Public Members

size\_t **used\_entries**

Amount of used entries.

size\_t **free\_entries**

Amount of free entries.

size\_t **total\_entries**

Amount all available entries.

size\_t **namespace\_count**

Amount name space.

#### Macros

**ESP\_ERR\_NVS\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

**ESP\_ERR\_NVS\_NOT\_FOUND**

Id namespace doesn't exist yet and mode is NVS\_READONLY

**ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

**ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

**ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

**ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

**ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

**ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

**ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

**ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

**ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

**ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

**ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

**ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

String or blob length is longer than supported by the implementation

**ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**NVS\_KEY\_NAME\_MAX\_SIZE**

Maximal length of NVS key name (including null terminator)

**Type Definitions**

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

```
typedef struct nvs_opaque_iterator_t *nvs_iterator_t  
    Opaque pointer type representing iterator to nvs entries
```

### Enumerations

```
enum nvs_open_mode_t  
    Mode of opening the non-volatile storage.
```

*Values:*

```
NVS_READONLY  
    Read only
```

```
NVS_READWRITE  
    Read and write
```

```
enum nvs_type_t  
    Types of variables.
```

*Values:*

```
NVS_TYPE_U8 = 0x01  
    Type uint8_t
```

```
NVS_TYPE_I8 = 0x11  
    Type int8_t
```

```
NVS_TYPE_U16 = 0x02  
    Type uint16_t
```

```
NVS_TYPE_I16 = 0x12  
    Type int16_t
```

```
NVS_TYPE_U32 = 0x04  
    Type uint32_t
```

```
NVS_TYPE_I32 = 0x14  
    Type int32_t
```

```
NVS_TYPE_U64 = 0x08  
    Type uint64_t
```

```
NVS_TYPE_I64 = 0x18  
    Type int64_t
```

```
NVS_TYPE_STR = 0x21  
    Type string
```

```
NVS_TYPE_BLOB = 0x42  
    Type blob
```

```
NVS_TYPE_ANY = 0xff  
    Must be last
```

## 2.6.4 NVS Partition Generator Utility

### Introduction
